Chapter 15 (1999)

‘Cultures do not exist’

Exploding self-evidences in the investigation of interculturality

to Richard Fardon

15.1. Introduction
When upon Heinz Kimmerle’s retirement in 1995 the chair of intercultural philosophy at the philosophical faculty, Erasmus University Rotterdam, fell vacant and the post was advertised, candidates were examined in the light of two major requirements: a sound knowledge of at least one non-European ‘culture’, and acquaintance with the Western philosophical tradition. As an anthropologist with extensive fieldwork experience in five African situations,¹ I, for one, can claim the first point, but precisely that relative expertise has inspired the provocative title of this chapter, originally delivered as my inaugural lecture when I succeeded Kimmerle. In the modern world, ‘cultures do not exist’ (any more), I will argue. Not so much in order to render the designation of the chair on intercultural philosophy inherently problematic (for surely if cultures do not exist, the adjective ‘intercultural’ as characterisation of a branch of philosophy cannot have any meaning), but in order to indicate the hand luggage² that I shall take with me to Philosophers’ Land. This hand luggage comprises

- first, insights that have been gathered in empirical research and which intercultural philosophy ought to take to heart; but also, secondly,
- philosophical problems that have been largely ignored in the context of cultural anthropology’s empiricism which for over a century has constituted the main mode of producing allegedly valid intercultural knowledge in academia.

This indicates the tension currently characterising my work. I have recently given up my chair in the social sciences for one in philosophy, but clearly I am not (yet) a philosopher – I continue to have difficulty reproducing and articulating ideas

¹ Rural Tunisia, urban Zambia, rural Zambia, rural Guinea-Bissau, and urban Botswana.
that seem to be self-evident to every philosopher, and I think I detect insurmountable problems in philosophical texts which to philosophers appear to be particularly well argued.

The structure of my argument is as follows. To begin with, I shall indicate how the concept of ‘culture’ has taken root as a key concept in our contemporary social experience and in philosophy. Precisely because it has done so, it is of the greatest importance to subject such self-evidences as attach to ‘culture’ to empirical and philosophical scrutiny. Now more than ever, the process of globalisation has brought together within a common political space a plurality of self-reflexive and militant identities; as this text is being finalised for the press, the truth of this statement is driven home by the violence against military and civilian targets in the USA on 11 September, 2001, by Middle Eastern Muslims holding just such a diabolical enemy image of the USA as the Americans do of them. An adequate analysis of this kind of situation will be of decisive importance for the fate of humanity in the first centuries of the third millennium CE. As a next step, I shall explore the conditions under which my claim that ‘cultures do not exist’ may acquire meaningfulness. Since, in this connection, I put forth the social sciences as an example for philosophy, I am compelled to discuss the place of empirical knowledge within philosophy. I shall stress that intercultural philosophy ought to take into account such knowledge as the empirical sciences have gathered through explicit and well-tried methods; and here I am thinking particularly of the empirical discourse on African ethnicity, and of the neo-diffusionist arguments in favour of extensive cultural connections in space and time informing Africa’s cultural history and its place in the world as a whole. But, as a next step, I shall argue – by reference to my own complex itinerary through Africanist cultural anthropology – how this particular empirical science, despite its unmistakable relevance for intercultural philosophy, is yet so philosophically naïve, and so disposed towards a North Atlantic epistemological perspective, that cultural anthropology can at best constitute a mere point of departure for our theoretical explorations of interculturality. Finally, I posit that intercultural mediation ideally situates itself beyond any specific cultural orientation, which allows me to characterise intercultural philosophy as the search for a transgressive and innovative, metacultural medium for the production of knowledge. It is the quest itself which makes this a commendable undertaking, even though its metacultural goal is unlikely to be ever reached.

15.2. ‘Cultures’ in contemporary society

Ever since the end of the eighteenth century CE, in Western scholarship and subsequently in North-Atlantic society as a whole, the concept of ‘culture’ has developed to acquire such great self-evidence that it has almost assumed a transcendental nature; in the latter respect therefore the concept of culture has come to be somewhat comparable to time, space, causality and substance – which in Kant’s philosophy are the basic categories utilised by human thought but not derived
Cultures do not exist: Interculturality’s exploding self-evidences

from sensory perception.\(^1\) Appropriated by the wider society, the concept of ‘culture’ combines claims of totality, unicity, integration, boundedness, and non-performativity. According to this conception, human beings at any one moment in time have, not a plurality of intersecting ‘cultural orientations’ co-existing simultaneously, but just one ‘culture’, and in that ‘culture’ they live their entire lives as if they have no option, as if displaying the distinctive features that mark them as adherents of that culture are free from ostentatiousness and from strategically calculated effect upon their social environments – in other words, free from performativity. The claim that such an allegedly unitary culture forms an integrated whole, springs forth from two kind of considerations:

• people’s assumption that, as far as human individuals are concerned, whatever is cultural, is the attribute of one (allegedly integrated) individual personality;
• ‘culture’ produces a meaningful world, that is to say, produces the illusion of a self-evidence that can only exist by virtue of the fact that no manifest limitations and boundary conditions are imposed upon that self-evidence in the consciousness of the bearer of that culture; for the sake of maintaining that illusion of self-evidence, of a self-evident universe contained in, and implied by, ‘a culture’, such a ‘culture’ has to be holistic (i.e. geared to a totality, a whole), and by consequence is implicitly intolerant of diversity.

In the last analysis we are dealing here with an implicit claim to universality made by the individual for her ‘culture’. This mechanism was already recognised by Kant when he claimed that whoever considers something beautiful, takes it for granted that it would be beautiful to anyone.\(^2\)

Moreover the above, unitary concept of ‘culture’ implies the assumption (and here lies the link with ethnicity) that this one ‘culture’ can be adequately designated by means of an ethnonym: ‘Dutch culture’, ‘Chinese culture’, ‘the culture of the Zambian Nkoya, of the Nigerian Yoruba, of the South African Zulu’, and so one. This produces the classic image that anthropologists have by now largely discarded, but that still has wide circulation outside anthropology: the image of Africa as a gaudy patchwork quilt of fundamentally different ‘cultures’, each of which constitutes an integrated, bounded totality. Nor is this conception of ‘culture’ limited to that of a merely descriptive category for the human situation: in contemporary public culture, the use of the concept of ‘culture’ has come to be closely associated with ethical and political judgements based on whether or not the person so judged shows respect for someone else’s ‘culture’.

What does it mean if someone insists that others should show respect for her own ‘culture’? It means more or less what follows. In a concrete interaction situation,

---

\(^1\) Kant 1983c.
\(^2\) Kant 1983b; Cf. Kimmerle & Oosterling 2000; of my contribution to the latter book, chapter 9 of the present book is a revised version. It reflects on Kant’s aesthetics in the light of an empirical African example.
where a person seeks to reinforce her claims to scarce resources (such as prestige, the right to vote, a residence permit, access to the markets of housing, education, employment, the liberties listed in catalogues of human rights), that person may explicitly appeal to a certain idea that has already been privileged by public opinion, and by bureaucratic and political practices and regulations. This is the idea that a person, not by her own free choice but by a determination in her innermost essence and totality, represents not only a universal but also a specific (notably cultural, or ‘ethnic’) mode of being human, a mode that she has in common with only a (usually quite small) small sub-section of humanity, on the grounds of a history shared with the other members of that sub-section, and expressed through practices specific to that sub-section as acquired through a learning process (for example speaking a common language).

In this insistence on respect a number of heterogeneous elements come together in the most surprising way: totality, essentialism, pluralism, the definition and structuring of the public space as multicultural, political strategy, and performativity. The respect claim expresses a conception according to which ‘culture’ represents a person’s total commitment, constituting the essence of that person. ‘Culture’ becomes the central identity; and like other identities, it legitimates itself by means of the construction of a subject that claims, with Luther:

‘Here I stand, I have no option.’

Interestingly, the person in question can only exhort others to respect his own ‘culture’, by himself taking a distance for his cultural existence, objectivating the latter and making it a topic of conversation. And such a distancing makes one aware of the cultural and ethnic otherness of others, of the accidental, contingent, nature of one’s own cultural and ethnic identity, as if one had, in fact, an option to end up with a different identity.1

This lends a double layer of performativity to the respect claim: that claim is explicitly performed within the public space,2 on the basis of a conscious distancing from the self; while the self has wanted, effected, perceived, and evaluated, the effect which that claim has on other people. In the contemporary world the convincing, public stance of authenticity and integrity (which in itself is performatively and therefore inherently self-defeating) is indispensable in order to render strategic identity claims successful – in order to gain recognition.

The respect claim displays a typical contradiction of postmodern North Atlantic society: whatever is introduced, in a strategic and performative manner, into the public arena is no longer allowed to be explicitly discussed in terms of strategy and performativity; on the contrary, public opinion, pressures towards political correctness (i.e. social etiquette), and even formal socio-legal rules (anti-discrimination legislation) are conducive to a situation where in public-arena expressions these

1 Cf. Mall 1995: 92. See however my discussion of Mall’s view, chapter 12.
elements are explicitly referred to in terms of ‘authenticity’. The concept of ‘culture’ (as a thinking in terms of ‘cultures’, plural) embodies this contraction. It is not a sign of bad faith. On the contrary, this contradiction is inevitable given contemporary conditions. Constituting itself by reference to ‘culture’, self-identity is always and inevitably situated in a field of tension between self-evidence and performativity. Thus the concept of ‘culture’ offers a contemporary solution for the perennial problem of society: how to negotiate the tension between individual and community. This makes ‘culture’ one of the principal empowering concepts at the disposal of political actors in the local, national and global arenas of our time.

The great attraction of this concept of ‘culture’ turns out to lie precisely in its capability of encompassing and concealing contradictions.

A social-science readership, in the present post-Marxist era, would be likely to realise that here I am referring to a formal, highly abstract conception of society, and of any social institution, relationship, situation and event, not as a structure or flow of concrete objects and persons but as a bundling of contradictions. A philosophical readership however might have to be specifically alerted to such a sociological view. Of course, the contradiction as a model of thought is a precondition for dialectics and has a splendid pedigree in mainstream philosophy. Yet philosophers (with the exception of post-structuralists and Marxists) may be inclined to consider the articulation of contradictions not an end in itself (as it would be for the anthropologist describing the formal abstract structure of a ritual in terms of contradictions between generations, genders, modes of production, conceptions of power and legitimacy, etc.), but as a stepping-stone towards the rational threshing out of these contradictions: if not in some Hegelian synthesis then at least in the elegance of academic prose.

How then does the concept of ‘culture’ deal with social contradictions? It offers the possibility of defining a central identity within which a person’s many identities as the player of many social roles can be rearranged within a hierarchical framework – which relegates the majority of these identities to a state of being secondary, unessential, invisible, while at the same time reaffirming (in a sense that I consider utterly artificial and performative) the cultural identity as that person’s deepest essence. This identity is supposed to define not just a partial aspect of an individual’s life, not one specific role, but a total life-world, whose parts hang together meaningfully and organically, have their place within the ensemble – resulting in a situation where the subject can confront the world as if that subject were a monolithic whole, and can find meaning and order in that world. The awareness of such a central and holistic cultural identity is not innate but is explicitly constructed in social communication (in other words, is learned), which often goes hand in hand with the cherishing of a collective historical experience and of selective culturally distinctive features; often also ethnic and cultural mobilisation by an elite is part of the process through which such a cultural identity is being constructed. Nevertheless the actors involved tend to succeed in representing this construction, not as the deliberate human creation of something that was not there in the first place, but as a mere...
taking consciousness of what allegedly had always been a person’s deepest and innermost essence. Such a construction is in line with modernity’s dominant collective representations: the unified, undivided, individual *subject*, and its *identity*. ‘Culture’ as a universally accepted term in North Atlantic society is a thought machine designed to turn subjectively the fragmentation, disintegration and performativity of the modern experience, into unity, coherence, and authenticity. Thus, the illusion of self-evidence and integrity are somehow saved in postmodern times when everyone knows that nothing is self-evident any more nor possesses integrity, and that autonomous subject and identity are illusory constructs.

In its insistence on an essential, authentic otherness, and in its dissimulation of performativity, this conception of ‘culture’ lands us with a huge social problem: it takes for granted, and even rejoices, in the presumed absolute difference alleged to exist between a plurality of positions, and hence freezes the public space to a snake-pit of absolute contradictions, where opposition may persist to the point of mortal combat. The decreased liveability of contemporary society may be attributed, to a certain extent, to the ever greater impregnability of an ever greater number of cultural fortresses. Only a few decades ago cultural relativism was simply an expression of the anti-hegemonic, anti-European critique of imperialism and colonialism. But now it risks becoming a nightmare: a licence to reduce contemporary society to an immovable stalemate of positions between which, on theoretical grounds, no open communication, identification, community or reconciliation is possible any longer; and violence remains as the only way out. However, as the Chinese philosopher Vincent Shen has rightly argued, such insistence on irresolvable differences (however much a respectable philosophical position since Nietzsche) is insufficient as a survival strategy for the modern world: in order for us to be able to face the future, we need dialogue, exchange, compromise, between the positions that have been occupied in the name of ‘culture’. Intercultural philosophy is nothing but an exploration of the possibilities that exist on this point. Intercultural philosophy, therefore, has a prophetic function, not in the derived sense of foretelling the future, but in the original (Greek and biblical) sense of uninvitedly speaking to contemporary society about its ills, predicaments and alternatives, while invoking a transcendent value or being.

---

1 For formulations of classic cultural relativism, cf. Herskovits 1973; Nowell-Smith 1971; Rudolph 1968; Teneules 1971. Also cf. Witherspoon 1981. In many respects, the problematic of cultural relativism is the mirror image of the problematic of interculturality; the field is too complex than to expect that justice will be done to it in the present, limited context. For an interesting exploration, cf. Procée 1991. Around Gellner an important group of critics of cultural relativism has formed, cf. Aya 1996; Boudon 1996; Gellner 1996. Also cf. the exchange between Geertz and Gellner: Geertz 1994; Gellner 1994; and Geertz 1984.

2 Shen, in preparation.
15.3. The background of the concept of ‘culture’ in cultural anthropology and philosophy

15.3.1. Culture in cultural anthropology

What is the origin of this concept of ‘culture’? It has a variegated history but its most common meaning is the popularisation of a cultural anthropological concept that, in that form, was only coined as recently as 1871 by Tylor in his book *Primitive Culture*.\(^1\) Tylor defines ‘culture’ as:

‘that complex whole which includes knowledge, belief, art, morals, law, custom and any other capabilities and habits acquired by man as a member of society.’

A century earlier, with Herder,\(^2\) ‘culture’ merely encompassed the so-called higher and public forms of human achievement (religion, art, science, constitutional arrangements); Herder’s merit was, however, that he included the peoples outside Europe among those having a measure of ‘culture’, showing himself surprisingly anti-ethnocentric in this respect.\(^3\) Tylor’s breakthrough was to go beyond ‘high culture’ to include, in his definition of culture, everything that was not given to man by nature, but of which he partakes as a member of a human group.

Tylor’s was not the last word. From 1900 onwards, in the United States and Great Britain, prolonged participant observation, carried by mastery of the local language, emerged as the principal empirical tool in cultural anthropology. This means that for the first time one had at one’s disposal abundant and convincing contemporary data on which to base an analysis geared to the distinctions and the meanings that the people under study applied in their own world view – an analysis that was *emic* in the sense of Pike’s paired concepts of *emic* and *etic* as propounded in the 1950s.

The paired concepts of *emic* and *etic* express the distinction between an internal structuring of a cultural orientation such as is found in the consciousness of its bearers, on the one hand, and, on the other, a structuring that is imposed from the outside. *Etic* has nothing to do with ethics in the sense of the philosophy of the judgement of human action in terms of good and evil. Pike’s terminology is based on a linguistic analogy. In linguistics one approaches the description of speech sounds from two complementary perspectives: that of phonetics (hence *etic*), which furnishes a purely external description, informed by anatomical and physical\

---

\(^1\) Tylor 1871.

\(^2\) Herder n.d.

\(^3\) This does not, however, exonerate him from charges of racism, which in recent debates have been levelled against not only Herder, but also Kant (in his non-critical, anthropological work) and other Enlightenment philosophers; cf. Eze 1996, 1997b; Bernal 1987; Rose 1990; Kant 1983e. However, these allegations have met with forceful defences of the Enlightenment philosophers as pillars of universalism and tolerance: Palter 1996b; Norton 1996; Jenkyns 1996. The truth is that, while unmistakably, and forgivably, children of their time and age and hence racists, they were often (like Herder in much of his writings, and Kant in his critical work), and to their great credit, able to rise above these limitations.
parameters, revolving on the air vibrations of which the speech sounds consist; and the perspective of phonology, whose basic unit of study is the phoneme (adj. phonemic, hence -emics): the smallest unit of speech sound that is effectively distinguished by language users competent in a particular language, basing themselves on the distinctive features of that speech sound. The phonetic features of actually produced speech sounds is subject to endless variation that can be registered by any observer and by whatever acoustic apparatus, regardless of competence in the particular language in question. By contrast, every spoken language has only a very limited range of phonemes (usually only a couple of dozen). Language users classify the infinite variety of actually produced speech sounds according to the elements of this series of recognised phonemes, and thus determine which words or sentences, consisting of several phonemes, are at hand in a particular situation.\footnote{Cf. Headland, Pike & Harris 1990; cf. Harris 1969, chapter 20, pp. 568-604 who was seriously criticised by Burling 1969; Müller 1983.}

Pike thus codified the two-stage analytical stance (both etic and emic) of the classic anthropology that had emerged in the second quarter of the twentieth century with such proponents as Malinowski, Evans-Pritchard, Fortes, Griaule and Leiris. Before this development, anthropology had been dominated by analysis in terms of externally imposed analytical schemes (the etic approach) such as evolutionism, diffusionism, materialism, theories concerning the fixed and universal phases of aesthetic development, etc. The rise of fieldwork and of an emic perspective meant that the empirical horizon of individual studies contracted greatly. Emic analysis required that one learned a new language and stayed on the spot for years. Such an investment, and the analysis based upon it, could only take place within a very narrow spatial and temporal horizon: that horizon which the fieldworker could cover by her own individual action – an area of at most a few thousand square kilometres and usually very much smaller, situated in a limited period of time that for the duration of the fieldwork and writing-up was even frozen into a stereotypified ‘ethnographic present’. Gone were the days, in cultural anthropology, of searching for extensive connections in space and time. The ethnographic monograph became the standard format of anthropological knowledge production, the ethnographer and her book came to identify with the name of the group under study, with the ethnonym. The idea arose that each such a monograph amounted to the description of ‘a culture’. Presumably there would be about as many ‘cultures’ as there were ethnographic monographs, and each ‘culture’ would be effectively conceived after the model of the book: bounded, internally integrated, consistent, unique – a whole that is well described with the term ‘holistic’. It became the anthropologist’s task to seek entrance to an ‘other culture’,\footnote{Cf. Beattie 1964.} conceived as a total, bounded, integrated and non-performative form of human existence – as a nearly impregnable fortress. Until quite recently, this view has determined the pathos and the rhetoric of fieldwork and ethnography. Henceforth, not only our vision of continents outside Europe, but also
the anthropologist’s individual career was to be organised around the ethnographic
standard monograph. Cultural relativism became the operative term for the respect
that anthropologists, and the outside world, owed to this fieldwork-related
celebration of distinctive otherness. Its emergence no doubt had to do with the way
in which individual anthropologists positioned themselves on the North Atlantic
academic market of intercultural knowledge: as monopolists peddling their own
unique knowledge of the reified culture where they had done individual fieldwork.

In another way cultural relativism was also instigated by the practice of
fieldwork. On the one hand, fieldwork, as an *emic* activity, claims the most far-
reaching intersubjectivity between fieldworker and host population; but, on the other
hand, it is a lonely and unique experience that essentially escapes external critical
assessment and hence among fellow-professionals is scarcely conducive to an
intersubjectivity based on shared external analytical (i.e. *etic*) abstraction from the
local culture under study. For this methodological dilemma the dogma of cultural
relativism has offered a safety net: under the aegis of cultural relativism it became
ideologically impossible, in professional anthropological circles, to express doubt
about the specific pronouncements of ethnographers; for since fellow professionals
lacked the prolonged personal experience with the local ethnographic context under
study, such doubt could only be based on the *etic* extrapolation of connections that
had merely been established for another ‘culture’ by applying an *emic* analysis
specific to that other ‘culture’ … Henceforth the professional stance of anthropol-
gists would be a combination of intradisciplinary avoidance1 in academia, among
anthropological colleagues, combined with the myth of such limitless communica-
tion in the field as could yield a comprehensive and allegedly valid view of the local
‘culture’ under investigation in the field. Anthropological restudies of the same
community by different fieldworkers have demonstrated that this methodological
dilemma is virtually without solution, a state of affairs that casts severe doubt on
anthropology’s claims of constituting a scientific discipline.

Whoever took up the academic study of cultural anthropology in the Netherlands
in the early 1960s, still had to learn the anthropological definition or definitions of
culture as an unmistakably technical term, as a far from obvious addition to the
common vocabulary2 with which one had left secondary school. But in the course of
the four decades that have since elapsed, the concept of culture has spread
worldwide (not only among the western Indo-European languages, but also outside)
to become one of the most frequently used and taken-for-granted terms by which to
express the contemporary world, its variety, and especially its conflicts. The concept

1 I am deliberately using the anthropological technical term ‘avoidance’, as defined in chapter 1.
3 How fast the social appropriation of the concept of ‘culture’ has proceeded in recent decades is manifest, for
instance, from the *Shorter Oxford Dictionary* of 1978 (Little et al. 1978), where ‘culture’ still only occurs in
the sense of religious worship (first attested in English in 1483), agriculture (1626), and civilising activity
(1510, 1805). Little et al. 1978 s.v. ‘culture’.
of culture was transformed from an academic technical term to a self-evident, common societal concept that nowadays is on the lips of almost all social actors regardless of their class or education. This transformation is closely related to the rise, in the last quarter of the twentieth century within the North Atlantic society, of a migrant population that stood out both in terms of geographical origin and of somatic characteristics. Another major factor of this transformation has been the cultural globalisation of our daily life, as the result of new techniques of communication and information that led among other effects to frequent displacements across great distances. More than ever before, it is evident that no cultural situation is homogeneous, that no culture exists in isolation, and that cultural specificity can only occur by virtue of a local, parochial boundary maintenance¹ in the face of an expanding, worldwide field of locally available and perceived cultural alternatives.

15.3.2. Culture in philosophy

Today not only social scientists and historians, but also philosophers frequently utilise the concept of ‘culture’; it is even one of the two constituent lexical elements in the expression ‘intercultural philosophy’, whose foundations my Rotterdam chair seeks to investigate. It is remarkable to what great extent philosophers (who usually are very critical in their use of concepts) have taken concepts such as ‘culture’, ‘cultures’, ‘cultural specificity’ and ‘interculturality’ for granted, as self-evident – as if the human condition could not be thought otherwise but in terms of a plurality, of a ‘multiversum’, of ‘cultures’.²

The following is a possible, perhaps even obvious, definition of ‘intercultural philosophy’ that remains so close to everyday language use that it takes on board the entire loading of ‘culture’ as a pre-scientific societal concept used by general actors in the modern world:

taking as its point of departure the existence, side by side, of a plurality of mutually distinct ‘cultures’, intercultural philosophy investigates the conditions under which an exchange can take between two or more different ‘cultures’, especially an exchange under such aspects as knowledge production of one culture about another; tolerance or intolerance; conflict or co-operation in the economic, social and political domain.³

In a more specific form of the above, we would conceive of intercultural philosophy as the search for a philosophical intermediate position where specialist philosophical thought seeks to escape from its presumed determination by any specific distinct ‘culture’. The following has been a common path along which

¹ The Belgian intercultural philosopher Libbrecht, originally a Sinologist, has stressed the constructedness of cultural boundaries eloquently and designed a sophisticated comparative model for intercultural philosophy in which this thought is applied particularly to East Asian material; Libbrecht 1995a, 1995b, 1999.
² Some examples from among countless many are: Appiah 1992; Copleston 1980; Ghyeky 1997a; Kimmerle 1994a; Mall 1995; Sogolo 1998; the latter article is an excerpt from: Sogolo 1993.
³ Cf. Mall 1995, chapter 1; Mall 1993.
philosophers have sought to effect such an escape: we render explicit the traditions of thought peculiar to a number of cultures, and we subsequently explore the possibilities of cross-fertilisation between these traditions of thought. By doing so, the emphasis is not on the philosophical enunciation of such intercultural practices in which non-philosophers are involved, but on the philosophical practice itself; and the central issue to be problematised is not the fact (or the illusion, see the final section of this chapter) of communication across cultural boundaries, but a comparison of conceptual contents on either side of such boundaries – as if intercultural communication in itself is a given that may already be taken for granted. Under the heading of ‘non-western’ or ‘comparative’ philosophy such a form of intercultural philosophy is frequently engaged in, but – to my mind – prematurely so, as long as the central concept of ‘interculturality’ (i.e. the fact, the conditions, and effects of communication across cultural boundaries) has been insufficiently analysed in its own right. It is as if we concentrate all our efforts on seeking to determine the coat pattern resulting from a cross between a zebra and a giraffe, without asking the question of whether such a cross could ever produce viable offspring in the first place.

In the more specifically ‘comparative-philosophy’ approach to interculturality, philosophers also tend to take their cue from a concept of ‘culture’ that is holist in nature, assuming an existential cultural identity that is the opposite of performative; such a concept coincides with the concept of ‘culture’ circulating in the wider society, which because of its built-in contradictions is directly linked to social power relations and ideological mystification. Thus the philosopher risks becoming the slave or the mouthpiece of his own society, at the very moment when he seeks to think away from the latter’s cultural structuring, and to apply a comparative perspective. Genuinely philosophical analysis would, on the contrary, consist of the attempt to expose terms that have become self-evident and are taken for granted, and to replace them – with good and explicit reasons – by other terms that are likely to offer new insights, since they are detached from the societal tissue of power and ideology, for instance as neologisms which never had that kind of social embedding in the first place.

Meanwhile it is easily understood why intercultural philosophers, of all people, have borrowed the concept of ‘culture’ from cultural anthropology. Let us consider these reasons now.

15.3.3. Philosophers against philosophical ethnocentrism and Eurocentrism

In the first place, the concept of ‘culture’, with its implied cultural relativism, offered philosophers the possibility to take a critical distance from Eurocentrism1 and ethnocentrism as characteristics of the mainstream of Western philosophy from Hegel to

---

1 Since the nineteenth century CE, Eurocentrism has taken a North Atlantic variant which comprises not only western Europe but also North America.
Rorty and the French post-structuralist philosophers. Hegel’s ethnocentrism and his contempt of Africa have been well documented. Rorty’s ethnocentrism is evident, conscious, and he shows it off. The reproach of ethnocentrism is laid at the doorstep of the French post-structuralists – Lyotard, Derrida, Foucault – by Rattansi. Nonetheless the latter allows himself to be largely inspired by their work for his Post-colonial Theory of racism, feminism and North Atlantic hegemony. Foucault travelled widely, held (or was considered for) intercontinental appointments, yet (with the exception of his notes on the Iranian revolution of 1978) in his philosophical and historical analyses almost completely limited himself to the North Atlantic region; this however did not prevent him from profoundly inspiring thinkers with a background and identity outside the North Atlantic region, as is clear from Mudimbe’s seminal The Invention of Africa (1988) – an emphatically Foucaultian book, although it is firmly based on the early Foucault and overlooks the developments in the latter’s work after the 1960s. To the French philosophers mentioned by Rattansi we might add Deleuze and Guattari. In their work, the exotic Other is repeatedly appropriated, in the most stereotypical fashion, merely in order to add further contrast to these authors’ statements concerning their own, North Atlantic, postmodern cultural orientations. At the same time, worldwide cultural diversity, and the intellectual problems which it poses, mainly feature in their work in a local and domesticated form: to the extent to which, over the last few decades, France itself has become a multicultural society. But we must also grant to Deleuze and Guattari what Rattansi had to grant to those French post-structuralists he does discuss: in principle their work contains the starting point for a non-ethnocentric theorising of processes of globalisation, identity and signification.

These are only signs of a changing tide, however. Until recently the Western philosopher implicitly took for granted that there is one, self-evident, social and cultural context (the North Atlantic one), and one self-evident language (his own). The twentieth century CE, especially, has seen a very great investment in the philosophical articulation of language and of social and cultural identity. Yet the philosophical investigation of interaction between two or more cultural and social contexts, two or more languages, is still in its infancy. Not only interculturality, but also interlinguality is a relatively underdeveloped aspect of mainstream Western philosophy. Philosophical approaches to interlinguality (concerning such topics as translation from one language into the other, and as the ethnographic representation

---

2 For striking relevant passages, cf. Rorty 1997; also cf. section 12.1 of the present book.
3 Rattansi 1994.
6 For an authoritative overview cf. Hale & Wright 1999.
Cultures do not exist: Interculturality’s exploding self-evidences

of concepts and representations embedded in a different cultural orientation) have been relatively rare\(^1\) and, what is more important, have not been accorded the central place in today’s mainstream Western philosophy that they deserve.\(^2\) In the contemporary world at large, under conditions of globalisation, problems of communication across linguistic and cultural boundaries are of vital political, economic, social and artistic importance. The ecological survival of humankind and the avoidance of a Third and probably final World War (over issues of race, ethnicity, the definition of such fundamental concepts as freedom, truth, legitimacy, personhood and the supernatural, economic hegemony, and North–South inequality) depend to a not inconsiderable extent on humankind’s increased capability of intercultural and interlinguistic communication, a future goal towards which philosophy is to deliver models of thought. Once again I may remind the reader of the prophetic mission of intercultural philosophy.

Meanwhile it is good to realise that currently not only the anthropological, but also the philosophical practice is based on the tacit assumption of the possibility of adequate translation — despite the existence of philosophical theories, such as Quine’s, claiming the indeterminacy of translation. Contemporary philosophers, including those in the most entrenched Western position, rely on a large number of predecessors, who wrote in the following languages among others: Greek, Latin, Italian, Arabic, Hebrew, French, English, German, Spanish, Russian, Polish, Danish, Dutch and Afrikaans. The great majority of philosophers only command one, two or three of these languages at the specialist level necessary for philosophical discourse and for independent research in the history of philosophy. Manifestly it is accepted practice that even professional philosophers consult the great majority of relevant philosophical texts in translation. Now in Western philosophy we are only dealing with two large linguistic families, Indo-European and Afro-Asiatic (the latter including the sub-family of Semitic, including Arabic and Hebrew); in intercultural philosophy the problem is substantially more complex, since this field in principle encompasses all\(^3\) current and extinct languages of the world.\(^4\) It is important to stress that philosophers in their everyday practice give every indication of a solid, self-evident trust in their own and other people’s capability of interlinguality — \textit{pace}

\[^2\text{Thus it is remarkable that in Genzler’s (1993) thorough review of contemporary translation theories in five chapters, only one chapter was devoted to \textit{philosophical theories notably deconstructionism à la Derrida c.s.}, while the great majority of reflection in this fundamental field of study came from cultural theorists, anthropologists and literary scholars.}

\[^3\text{Cf. Raju 1966.}

\[^4\text{In the face of such global diversity, one is amazed to see the term ‘intercultural’ frequently used to refer to exchanges between speakers of German, English, French, Spanish, Italian, Dutch, Portuguese, and Scandinavian languages within the European Union – as if these languages could still legitimately count as the boundary marker of just as many distinct ‘cultures’. I prefer to see the European case as a plurality intimately related to closely related local linguistic forms within one comprehensive North Atlantic civilisation at the beginning of the third millennium of the Common Era.}

471
Quine. This does not make them our best *prima facie* guides in the exploration of problems of interlinguality as an aspect of interculturality.

Modern philosophy’s ethnocentrism is probably, more than anything else, and far from being the manifestation of a sinister anti-South complot, merely a pardonable simplification: within one language, one cultural orientation, most philosophical problems are already highly aporetic – without issue, without solution. Yet intermeshing plurality, in combination with people’s identity retreat inside apparently unassailable boundaries, is the central experience of the contemporary world, and in this light Western philosophy’s standard simplification of its problem field to just one language and one culture is increasingly unacceptable.

15.3.4. Culture and difference

Also, the second reason why philosophers have taken over the Tylorian concept of ‘culture’ is largely internal philosophical: the convergence of the concept of culture with the creation, by post-structuralists such as Derrida, Lyotard, Deleuze and Guattari, of a sophisticated conceptual apparatus for the thinking and handling of *difference*. Here the logocentric fascination with binary contradictions, which has captivated Western thought from the Presocratics right up to Hegel, Marx and the twentieth-century structuralists such as Lévi-Strauss, suddenly appeared in a different and critical light. Post-structuralism, which as a strategy of difference contained the possibility both of deconstructing and of affirming identity at the same time, came after two major intellectual movements (Marxism, structuralism) which relegated the diversity of ‘cultures’ to the status of an epiphenomenon; for both movements denied the specificity of distinct cultures in the light of some postulated more fundamental condition (‘the historical inevitability of the struggle over material production and appropriation’ in Marxism; or alternatively, ‘the innate binary structure of the human mind’ in structuralism) effectively reducing *emic* otherness to *etic* sameness. With the realisation that the binary opposition is a figure of thought whose two poles in fact may to some extent (like the *ouroboros* snake biting its tail in ancient Hermetic and alchemistic symbolism) contain each other and dissolve into each other, doubt was cast on two major strategies of thought, hitherto taken for granted:

(a) the reduction of otherness to sameness (as in Marxism and structuralism), and
(b) the entrenched conception of otherness as amounting to an absolute and irresolvable difference (as in Shen’s dilemma).

Both strategies are of prime political importance in the contemporary globalising world: under the hegemonic onslaught of North Atlantic social, cultural, scientific and political forms, ultimately backed by the superior military power of the NATO,

1 I am grateful to Heinz Kimmerle and Henk Oosterling for pointing out serious shortcomings in an earlier version of this paragraph.
and particularly the USA, there are strong pressures upon any person, community and polity outside the centre of power, either to submit to being co-opted into sameness (a), or to be subjected to exclusion as irretrievably different (b). For the post-structural ‘philosophy of difference’, difference becomes a basis for a recognition of the other as both equivalent and other – as a basis for respect instead of either appropriative imposition (a) or exclusion (b). At the same time, the philosopher is reminded of the possibility that whatever sameness to self he believed himself to recognise in the other, might well be vain self-projection, appropriation, and subjugation – and for this reason grand schemes as to some ultimate, underlying convergence of humankind, of all cultures and languages of the world, of all Old-World cultures, of all philosophical traditions worldwide, of all African cultures, etc., are treated with suspicion.¹ The difference-orientated intercultural philosopher wholeheartedly affirms what anthropologists had discovered decades earlier: culture is a machine for the production of difference, especially where initially there was undifferentiated and unarticulated sameness. For intercultural philosophy the anthropological concept of ‘culture’ turns out to be a tool for the articulation of collective positions of difference that may count as accepted points of departure for social and political action, in such a way that any attempt to merge these positions of difference into a higher unity will be dismissed as an assault (modernist or hegemonic) on their integrity.²

But while this is a laudable position that converges with the cultural relativism dominating anthropology from the mid-twentieth century onward, there is a price to be paid for the philosophical adoption of the anthropological concept of culture: Shen’s dilemma then can no longer be solved. Cultural relativism, which was ushered into intercultural philosophy with the best of intentions, ultimately means an impediment towards the fulfilment of intercultural philosophy’s most urgent social responsibility.

Philosophers have taken over the Tylorian concept of ‘culture’ as a strange body, a black box, without attempt to attune it systematically to other contemporary philosophical concepts such as category, subject, mind, the state, etc. In philosophy, the concept of ‘culture’ has an interesting history that however does not lead straight to Tylor. The origin of the concept lies in Roman antiquity: Cicero’s cultura animi in the Stoic sense of spiritual exercise through reticence and respectful sociability. An absolute concept of ‘culture’ as referring to human action within a society was first used by the seventeenth-century theoretician of natural law Pufendorf. When one century later Herder added to this the notion of historicity, and began to speak of the ‘culture’ of specific peoples, the basis had been laid for a philosophy of culture. And such a philosophy of culture did materialise, with considerable delay, in the

¹ I am playing the devil’s advocate here. Practically all my historical and philosophical research since 1990 has been devoted to establishing the theoretical, methodological and empirical conditions for the claims of an ultimate historical unity of mankind. We come back to this below.

beginning of the twentieth century, with philosophers like Dilthey, Rickert, Cassirer and Simmel; but it was to address almost exclusively European culture.¹ Even Spengler’s worldwide perspective, which at first view would have little that is condescending vis-à-vis other civilisations,² had yet been inspired by the question as to the future of European civilisation.³ The German school of cultural philosophy around 1900 counted among its ranks, however, one writer who inexhaustibly and with visionary powers wrote about non-Western civilisations: Max Weber – but he can scarcely be considered a philosopher any more. The main achievement of this phase of the philosophy of culture was the development of a macro perspective on civilisations and cultures as totalities, occasionally (Rothacker, Gehlen)⁴ in confrontation with nature in the context of the historical genesis of man at the beginning of the Palaeolithic. Such philosophy of culture did have a profound effect on the social sciences in many respects (it stressed particularly the hermeneutic stance of Verstehen, that soon was to be popularised through Weber’s writings),⁵ but its concept of ‘culture’ proved a dead end. If contemporary philosophers use the concept of ‘culture’ this is not in continuity with the philosophy of culture in Germany around the turn of the twentieth century, but in the sense of contemporary cultural anthropologists as heirs to Tylor. As the authoritative Historisches Wörterbuch der Philosophie states, almost with relief:

‘Empirical cultural anthropology has nothing to do with the Kulturanthropologie of the German tradition in philosophy and the humanities.’⁶

Before 1960 (when Winch initiated the important debate on rationality and the analysis of exotic cultures)⁷ philosophy could scarcely offer an elaborate discourse on the encounter between ‘cultures’ at the micro level of individual participants and their concrete interaction situations, or on the production of knowledge at the

1 Perpeet 1974, with exhaustive bibliographical references. The history of the concept of ‘culture’ between Roman antiquity and the eighteenth century is exhaustively treated in: Niedermann 1941.
2 I define a civilisation as a socio-political system which – by virtue of such institutions as food production, state formation, writing and organised religion – displays a considerable degree of continuity over a vast geographical area and within which a plurality of cultural orientations are contained. The contradiction between ‘culture’ and civilisation, as posed by Kant and as elaborated by Spengler, is not fertile from a cultural anthropological perspective. Outside the German language area it has not been common to make such a distinction. Cf. Perpeet 1974, especially cols. 1318f.; Kant 1983a; Spengler 1993: 42ff.
3 Spengler 1993.
boundary claimed to exist between ‘cultures’. It is only for a slightly longer period that the sub-discipline of ‘comparative philosophy’ has existed; here the European, Chinese and Indian traditions – often characterised as ‘cultures’ in the sense critiqued above – are scrutinised for the extent to which they possess parallel themes. Islamic and African philosophy offer specific problems of classification for this sub-discipline. Islamic philosophy does so in that, in the few centuries that it can be said to have flourished (notably in the third to fifth centuries AH, i.e. in the eighth to eleventh centuries CE), it remained so close to classic Greek philosophy as to be virtually a branch of that tradition; African philosophy poses a classificatory problem because it is either very old but largely unrecorded (a point of view held by many passionate defenders of African philosophy), or (as Hountondji would have it) new and largely tributary to the North Atlantic academic philosophical tradition.

Understandably, contemporary philosophers have given in to the temptation of adopting the anthropological concept of ‘culture’, and to apply it within their own philosophical arguments without further revision. Thus, by the middle of the twentieth century philosophy ended up with a concept of ‘culture’ that displayed heavily holistic and essentialist traits just as in that concept’s original cultural anthropological setting, and that was too naïve to problematise the performative aspects of cultural identity. However, in the last thirty years especially cultural anthropology, of all disciplines, has had no choice but to take a more relative and dynamic view of the concept of ‘culture’. The two main related factors of this development have been the emerging theory of ethnicity (see below, section 15.7), and the need to account analytically for globalisation and the resulting multicultural society of the late twentieth century of the Common Era. This process in anthropology certainly has parallels\(^1\) in philosophy (especially in the post-structuralist philosophy of difference) that have been a major inspiration in the development of intercultural philosophy,\(^2\) despite the implicit Eurocentrism for which the most prominent post-structuralists have been chided.

15.4. From ‘holistic culture’ to partial ‘cultural orientations’

Meanwhile the provocative title of this chapter, ‘Cultures do not exist’, must not be read as if I wish to banish forever the concept of ‘culture’ from intellectual discourse. Besides, such an attempt would be futile considering the way in which that concept has taken root in the non-specialist societal discourse of our time, globally and in all walks of life. I am not rejecting the idea of specific forms of programming of human representations and behaviour – a programming that is

---

\(^1\) For the potential relevance of Guattari & Deleuze’s work for contemporary cultural anthropology, cf. van Binsbergen 1999g. Meanwhile this does not take away the fact that – as I argue at length in the article cited – Guattari himself has only realised this potential in a very partial way, while relying on concepts and points of view which are unacceptable for professional anthropologists today.

specific in space and time, that has an internal systematics, that is not idiosyncratic and limited to just one human being but on the contrary is shared, by virtue of learning processes, by a number of people, yet remains limited to a relatively small sub-set of humanity. This idea is based on undeniable empirical factors that every human being sees confirmed innumerable times in his pre-scientific everyday social experience. Such forms of programming I prefer to call, not ‘cultures’ but *cultural orientations*, in order to avoid the suggestion that, on the one hand, they order total human life on a grand scale and yet, on the other hand and at the same time, can be considered bounded, integrated and unique.

As long as we admit the situationality, multiplicity and performativity of ‘culture’ (a number of crucial insights of which a term like ‘cultural orientation’ reminds us), there is no longer a stringent reason to banish the words ‘culture’ and ‘cultural’ from our philosophical conceptual toolbox. The reader may rest assured: if the inaugural address on which this chapter is based, was to mark my accession to the Rotterdam chair of ‘intercultural philosophy’, it did not intend to do so by destroying the very notion of ‘culture’ on which ‘intercultural’ is inevitably based, nor by destroying the emerging branch of philosophy designated by that notion.

If the cultural is a form of programming, then it would be characterised by a systematic aspect rather than by the absence of systematics. The contradiction between structuralists and post-structuralist resides, among other points, in the post-structuralists casting doubt on the systemic nature of the cultural experience. This contradiction arises, in part, from the erroneous choice of too high a level of abstraction. If one conceives of ‘cultures’ as bounded, integrated totalities that may be adequately designated by means of an ethnonym,1 and within which a human being can lead a complete life from morning to evening and from birth to death, without necessarily crossing into other ‘cultures’, then it would inevitably come to light that the claim of a cultural systematics is an illusion, behind which lies, in reality, the kaleidoscopic effects of multiple cultural orientations that criss-cross each other simultaneously, and each of which is built on systemic principles that are not informing the others.

In earlier centuries the state and a world religion such as Christianity and Islam were often capable of imposing upon this multiplicity of cultural orientations their own hierarchical ordering, resulting in a constellation that might loosely be described as ‘Islamic culture’ or ‘Christian culture’; but today in the North Atlantic region the state and world religions are no longer capable of doing so. In the first place, there is the specificity of cultural orientations associated with distinct classes, professional groups, levels of education, linguistic communities, religious communities. Even when we limit ourselves to a consideration of those roles that

---

1 Considering the abundance of ethnmonic reference in his work, this is implicitly the – obsolescent – position taken by Lévi-Strauss and by most anthropologists of his generation. The post-structuralist philosophers have only a limited discourse on other cultural orientations than those which have been bundled in contemporary North Atlantic society.
have been acquired by a learning process and that are being played in the public space, we have to admit that practically every human being finds himself at the intersection of a number of different cultural orientations, between which there is often no systematic connection.

Take notions of purity. The androgynous tenderness and the psychological immunity to polluting dirt informing my role as a father changing my young children’s diapers has nothing to do with the very different stress on very different conceptions of purity which I invoke in totally different social settings activating totally different social roles and identities on my part: for example the histrionic display of anger that I summon when finding a hair in the soup served in an expensive restaurant when I am entertaining a visiting professor from Africa; or the undodging sense of impeccable formal purity with which I yield to the tyrannical syntactic requirements of a computer language when writing computer programs; or the relish with which I use my fingers as ready-made brushes in my amateur painting; or the stoic resignation with which I have daily braved cockroaches, rotten meat, and mouldy staple food in certain parts of Africa under famine conditions.

Cultural systematics do exist within each distinct cultural orientation, but not necessarily between various cultural orientations. Moreover, in the context of the contemporary, globalising world there is, in the sphere of private life, nutrition and other forms of consumption, recreation, gender and sexuality, a constantly increasing plurality of lifestyles at various stages of articulate definition, and all these lifestyles (each with greater or lesser degrees of distinctness, boundedness, and conspicuousness through a specific name and other boundary markers) yield their own microscopic cultural orientation. The subject who finds himself at the intersection of all these orientations is a fragmented, kaleidoscopic subject to which we would be wrong to attribute a high degree of integration – perhaps it has even disappeared as a subject. It is as if today’s secularised, globalising society has, more than any other historical societies, furthered the fragmentation of the subject. But in a formal sense the situation in other societies is not fundamentally different in that these societies too consist of the bundling (that is only effected at the level of the complex role behaviour and ego consciousness of individual participants) of a plurality of cultural orientations between which there is no systemic internal correspondence or coherence.

For instance, throughout the nineteenth and twentieth centuries the socio-cultural life of the Nkoya people of western Zambia was built up out of the contradiction between two enmeshing cultural orientations: village life, based on autarkic agricultural production and hunting, kinship, and non-violence as the principle governing interpersonal relations; and court life, based on the parasitic, non-productive exploitation of village communities for food, other produce, and human personnel, and governed by the denial of principles of kinship and non-violence.²

1 Van Binsbergen 1999d.
The anthropological approach in terms of the articulation of modes of production\(^1\) could have such a great success in the 1970s–1980s precisely because it was the theoretical expression of the empirical fact that also archaic, non-Western societies display not a totally integrated structure but instead a diversity of orderings, each of which has its own systematics, its own distinct internal logic, such as that theoretical approach analysed – no doubt one-sidedly – from the perspective of production.

If we could at all speak of a system at the level of society as a whole, then it would certainly not be an all-embracing, holistic *cultural* system, but a system of economic and political control – and the economic and the political constitute dimensions of social life that scarcely enter the discourse of structuralists, who otherwise have been the prime champions of the systemic nature of culture.

The most obvious way of identifying the various cultural orientations that may be discerned within one society is by searching, within the cultural practices of that society, for consistent (in other words systematic) semantic fields that have a limited extension and whose limitation consists in their being denied, challenged, combated or destroyed by other, adjacent, differently structured semantic fields. It is in this way – by assessing the range of application of specific semantic fields in empirically documented mythical and ritual contexts, and ascertaining where this application became excessively contradictory or came into open conflict with other, differently constructed semantic fields – that I was capable of identifying various religious complexes in the society of western central Zambia, each religious complex as the ideological component of a specific mode of production: ancestor veneration, the veneration of royal ancestors, of the High God, of spirits that are not supposed to be bound to specific localised communities, etc.\(^2\)

In this sense, at a much lower level of aggregation than the society as a whole, the distinct cultural orientations do have a systemic character, by definition. Acquiring a cultural orientation through a learning process amounts to programming that systematics onto the behaviour of the individual participants. Of the many cultural orientations that are present in a society, everyone learns a few score in the course of his life, and the ethnographer (as well as the trader, the sailor, the diplomat, the itinerant traditional healer, etc.) learns a few additional ones that belong to a different society and that are not or hardly present in his own society of origin.

‘Cultures’ in the holist sense do not exist except as the illusions of the participants. However, social actors in the world today explicitly utilise the concept of ‘culture’, and they do so in the same polysemic and contradictory way in which most indigenous concepts are used by social actors. This is a major reason why the concept of ‘culture’ is hardly useful any more as a technical term for philosophy or

---

\(^2\) Cf. van Binsbergen 1981a.
Cultures do not exist: Interculturality’s exploding self-evidences

empirical social science. Meanwhile, in the hands of social actors, the very concept of ‘culture’ may bring about effects that are horrifyingly real:

- the Nazi Holocaust;
- ethnic cleansing in late-twentieth century Europe and Africa;
- ethnic politics that have led to the absolute erosion of the constitutional structures of many African states today, in a dual process encompassing first their experiences after territorial decolonisation, then their experiences after the democratisation movement of around 1990;
- multicultural, migrancy and refugee policies in West European states today that rely on the reference to ‘cultures’, in the plural, to stress the differences between social actors, but that are incapable of curbing the rising feelings of frustration, insecurity, hatred and alienation in those countries;
- the rise of a mutual enemy image composed of stereotypical cultural traits separating Middle Eastern Muslim Arabs and North Atlantic Americans.

‘Unreal in existence, real in effect’, is one of the current definitions of the concept of virtuality. The contemporary social experience is full of such virtuality. For instance, the concept of ‘culture’ emerged from the world of science (as an etic term), but via the media and the educational institutions it has transformed itself and begins to reverberate in widespread feedback like an ill-adjusted public address system. Members of contemporary, globalising society have appropriated the concept of culture as an empowering emic term, no longer controllable from its original base in science. This is only one example, among very many processes of dislocation, where cultural products from a specific localisable provenience are appropriated into subsequent contexts that are rather alien to the original one and largely independent from it; in the process, the original product is transformed, whereas the appropriating contexts can be said to constitute themselves through the very process of virtualising appropriation.¹ As an emic term ‘cultures’ (plural) is a virtual concept that is no longer at home in philosophy or in empirical social science except in order to be deconstructed in a bid to lay bare its underlying semantic structure and political implications – always in the hope that such critical deconstruction (as in the present argument) will also find its way to the wider society.

15.5. The relativity of an empirical perspective

For the philosopher the statement ‘cultures do not exist’ is problematic, not in the first instance because of the concept of ‘culture’, but because of the word ‘exist’.

The question concerning existence, and the question concerning the possibilities and conditions of knowledge (knowledge about that which exists) are among the

most important ones in philosophy. Empirical science is in no position whatsoever to answer these questions for us, for it thrives, itself, on the basis of specific – albeit usually implicit – choices from among the many possible answers to the questions concerning being and concerning knowledge. If, for instance, one adopts, as in Buddhist philosophy, the position that the reality to which the senses appear to testify is merely an illusion, whereas the true Being only becomes knowable after many phases (for most people very difficult, or impossible, to traverse) of meditative distancing from the apparently concrete world of the senses, then from such a perspective the idea of empirical science is absolutely absurd; but whereas the Buddhist school of thought dominated China, among other parts of Asia, for centuries (after which it lost its grip on China), in that same country Taoism, as the older and more persistent school, displayed an orientation towards sensory reality characterised by far greater kinship with Western science.

Empirical science presupposes a kind of realism: the assumption that there is a reality out there that is not limited to consciousness (although it may be in consciousness that the categories are given with which to gather knowledge of that reality), but that also has concrete, factual manifestation in a manner which is in principle independent from consciousness. The dynamics of empirical science take place between consciousness and sensory perception, between concrete fact and category of thought, and between the individual researcher and the collectivity of researchers. On the one hand, there is the collectivity of scientists that only under far-reaching conditions of method, consistency and conformity admits modes of individual knowledge to the realm of intersubjectivity and thus declares these individual modes to amount to science; on the other hand, there is the social collectivity: the latter’s reception of scientific production is the end goal of such production. As I have stressed in the Introduction to this book, that reception is problematic: scientific insights may be built into a society’s collective representations, but then they cease by definition to be scientific, and many collective representations reflect the science, not of today, but of yesterday. On the other hand, collective representations constitute a major distortive influence on individual and collective processes of scientific observation and conceptualisation in the first place.

Empirical scientists are seldom conscious of the fact that their professionalised form of knowledge production implies a number of essentially arbitrary choices in the fields of epistemology and ontology. They can afford this naivety since, in the course of the last few centuries in the North Atlantic region, empirical sciences have developed into a self-evident, taken-for-granted institution; this institution reflects, underpins, and increasingly legitimates, power relations – in ways Foucault more than any other modern thinker has helped us to recognise. And here I do not refer in the first place to such power relations as exist within the world of science itself and are responsible for the fact that the scientific ‘state of the art’ as accepted by the

---

1 Needham c.s. 1961, 1956; Beckh 1961.
Cultures do not exist: Interculturality’s exploding self-evidences

community of scientists is always a shifting compromise of intra-disciplinary power relations; that is understood. But the power aspect of modern empirical science reaches much further. Such science is a nursery for universality claims concerning the reality of the senses – claims such as

- ‘$V = i \cdot R$’ (Ohm’s law)
- ‘photosynthesis is the source of all energy for life forms on earth’
- ‘all human societies possess “cat’s cradles”’ (rope figures) as well as some kind of incest prohibition’.

But the impact of such scientific universality is not limited to the domain of science alone. In the contemporary North Atlantic region, empirical science sets the example of truths that are surrounded with great authority and connotations of universality. It has become a major legitimating force, its example breeds in the minds of contemporary citizens the preparedness to accept other universalist claims, those of a socio-political nature, that are determining the contemporary world to a high degree but that, because of their normative or performative nature, cannot possibly be based on empirical science. I mean such ideas as

- the self-evident authority of the modern state and of her principal instrument, the formal organisation
- the self-evidently universal nature (if not in application then at least in allegedly universal applicability) of human rights and of the democratic constitutional form of the state
- the self-evidence and inviolability of the subject, of identity, and of ‘culture’
- the self-evident claim that universalism has primarily sought North Atlantic social, cultural, political and scientific forms to express itself (as in Hegel’s Eurocentrism), which accords to these forms of self-evident superiority as underpinning the globally hegemonic project that has characterised the North Atlantic region ever since the sixteenth century CE.

Such self-evidences, far from being scientific, belong to the collective representations which form the preconditions of the North Atlantic social order.

Manifestly, empirical science is just another cultural orientation among the many other such orientations of North Atlantic society; and it is one of extraordinary importance for the production of the self-evidences that not only determines the structure of our own lives but in which also superiority claims reverberate vis-à-vis the rest of the world. Empirical science posits a form of life that in the last analysis may turn out to be Eurocentric and hegemonic. But at the same time it tries to wrench itself free from this particularistic and regional societal grip by making its methods and techniques highly explicit, refined and intersubjective. This is why radical anti-hegemonic discourses make such a point of advocating epistemological alternatives to current empirical science – for instance, in the form of a specifically African epistemology, or by asking – as in Harding’s approach – if current empirical
Chapter 15

sciences can be reduced to the status of merely one specific, culturally determined, local form of knowledge (an 'ethnoscience'), in the midst of the infinite number of conceivable ethnosciences from all over the globe.1

With regard to the type of phenomena that is usually studied by the natural sciences, Harding’s suggestion that modern science is maybe merely an ethnoscience of the North Atlantic region would at first sight appear to be little convincing. However, if we read Harding carefully we will find that her feminist and Third World perspective on modern science yet leaves largely intact modern science’s claims to universality, objectivity and rationality – in other words, its claims to an universalisable epistemological underpinning of its truth, and not just a political underpinning which only holds for the here and the now of current geopolitical power relations. This notwithstanding the fact that other forms of knowledge based elsewhere in the world may lay similar claims. Despite its considerable epistemological underpinning, North Atlantic science should try to learn from these other forms of knowledge if it ever wants to shed the one-sidedness springing from its historical association and European/North Atlantic hegemony.2

No matter how much we may claim that natural scientific knowledge is arbitrary, local, and potentially subservient to Eurocentrism, yet planes based on that knowledge do not spontaneously crash into the ground as soon as they venture outside the North Atlantic region, watches keep on ticking, the electromagnetic waves generated under this scientific regime turn out to have an apparently unlimited action radius so that they may be transmitted back to earth via man-made spacecraft travelling to the Moon, or even beyond Saturn, and biochemical medicine enjoys it considerable (though by no means unlimited) successes all over the world regardless of the cultural and somatic specificity of its practitioners and its patients.3 Third World revolutionary movements that radically steer away from North Atlantic cultural orientations, acquire and utilise for the furthering of their cause manufactured products (weaponry, aeroplanes, Information and Communication Technology) whose successful use in their hands is manifestly not impeded by these movements being alien to, or even deliberately opposed to, North Atlantic cultural orientations. World view is simply not the decisive factor for science and technology to work: these weapons work just the same in the hands of bandits who operate without explicit ideological positioning and who, thriving in the many pockets of ineffective state control throughout the Third, Second and increasingly even First World today, are responsible for the escalating privatisation of violence.

---

2 Cf. van Binsbergen 2001c and 2002c.

3 Contemporary epistemological insights begin to take a distance from the distinction between natural sciences and humanities (‘Geisteswissenschaften’ that only one or two generations ago was taken for granted (cf. d’Agostino 1993, who bases himself specifically on: Bernstein 1983; Rorty 1979; Putnam 1978, 1981). I myself also make only a gradual distinction between natural and social sciences when it comes to the possibility and desirability of alternative epistemologies.
The unmistakable success of North Atlantic natural, medical and technical science, although based on the dominant epistemologies informing mainstream North Atlantic academic research and academic practice, does not ipso facto exclude other epistemologies, from other cultural backgrounds, for the description and explanation of natural phenomena – and many such epistemologies have managed to persist for centuries in their concrete practical niches of agriculture, hunting, metallurgy, house construction, magic and therapy. There they apparently offered an attractive mode of explanation that adequately took care of the necessity of survival precisely within the local natural environment which these alternative epistemologies sought to describe and master. Thinking through the plurality of possible epistemologies for the approach to sensory reality is one of the tasks confronting intercultural philosophy, as we have seen in chapter 7 of this book.

Natural science today finds itself in a field of tension. To a certain extent it is entitled to the claim of being cosmopolitan, universalist, part of the common heritage of humankind. On the other hand, it is to a great extent the specific and recent creation of North Atlantic modernity, charged with a heavy hegemonic burden. This applies a fortiori to the social sciences. The phenomena that the latter study are largely the product of human intentionality and signification. And by virtue of this fact any social scientific epistemology will, to a large extent, have an ethnocentric bias derived from the society (still principally the North Atlantic one) from whose midst social science research is being conceived and executed even if the object of research is to be found outside the North Atlantic region (as is often the case for anthropology). The specific social-science epistemology employed constitutes simply one specific choice for the construction of self-evidences, which in the society under study would be constructed differently. Whatever poses as an impartial, objective scientific perspective is therefore in the best case the confrontation between two sets of self-evidences of matching strength but different contents; and in the worst case the denial of the value and the rights of the other society.

In this context it is unusual, and risky, to appeal to empirical social sciences in order to correct current philosophical approaches of interculturality. Yet this is what I am about to do. Worse still, I will go even further and claim that philosophy itself is much more of an empirical science than philosophers are prepared to admit.

15.6. Philosophy as empirical science?
It is quite usual that philosophy appropriates elements from the empirical sciences, and even though this kind of interdisciplinary borrowings tends to lag a few decades behind the state-of-the-art in the discipline from which it is being borrowed, yet

---

1 This contradiction is at the heart of my philosophical treatment of Information and Communication Technology in chapter 13.
without such appropriation philosophy could not pursue fundamental research into the foundations of the empirical sciences.

Some philosophers take the position that the upward flight of philosophy should not be thwarted by empirical ‘so-called facts’. Philosophy may then be conceived as the investigation of concepts, methods of argument, and meanings, and hence as the development (with a precarious balance between innovative originality and intra-disciplinary intersubjectivity\(^1\)), the testing out and the administration, of language forms capable of articulating the aporias of the contemporary existence, notably in a way that is not yet furnished by other human practices (empirical sciences, belles lettres, other forms of art, politics and religious discourse). In this conception philosophy is a specific practice whose ontological referent, in the last analysis, is the contemporary social experience (in which, however, the experience of other points in space and time may reverberate so that these past and exotic human experiences should also be incorporated in the philosophical exercise). From this point of view it would be hard to defend a totally non-empirical conception of philosophy – even though we had to admit the need for a non-empirical component: for technical research leading to ever better tools in the domain of conceptualisation and logic which do not strikingly reflect an experience that is specific in space and time.

Philosophy thus shares with belles lettres the development of language forms that promise a superior insight. However, contrary to the literary writer, the philosopher seldom works entirely for his own account: most philosophical writings thrive on the rendering and interpretation of the thought systems of other explicitly mentioned philosophers and philosophical movements. The sources for the latter constitute an empirical referent that, ontologically, has almost the same status as the data on which literature scholars, historians and cultural anthropologists base themselves. This raises the same questions as to method, disciplinary intersubjectivity, societal appropriation, cultural bias and the resonance of general societal power relations in the production of knowledge. It would be to philosophy’s advantage if, for this life-size empirical dimension of its practice, it put a greater premium on method, and a lesser premium on originality. Nearly every decade invents its own reading of Nietzsche, Hegel, Plato, or the Presocratics; if the reference to an existing philosophical oeuvre or corpus is to be more than a polite pretext for speaking about our own concerns today in terms of, largely, our own discourse, such a re-reading should simply follow the critical canons established in literary and historiographic empirical research.

Coming from an empirical scientist who insists on the methods and results of contemporary empirical science as an example for philosophy, my argument here may remind one of that of the physicists Sokal and Bricmont a few years ago. In the most Droogstoppel-like fashion they demonstrate how the appropriation of a contemporary physics idiom has yielded some of the most obscure pages of the most

\(^1\) On philosophy as an intersubjective activity, cf. e.g. Luijpen 1980, chapter 1.
prominent French philosophers. They derive their sense of being right from an experiment that Sokal conducted within the pages of the cultural studies journal *Social Text*. There he treated, tongue in cheek, current quantum physics as an esoteric text requiring a postmodern hermeneutics. He reproduced in what he himself considered a nonsensical article the post-structuralist idiom so faithfully that the article was accepted for publication as a serious contribution. Sokal and Bricmont can think of nothing better but to assess the philosophical use of idiom in the light of the conventional meaning of the terms in question in their original physics and mathematics context. This approach smacks of parochialism and essentialism, and is out of touch with the contemporary world at large, where borrowing across boundaries (including disciplinary boundaries), followed by far-reaching transformative localisation of the borrowed goods at their new destination, is the order of the day. My point of view is fundamentally different from theirs: they do not make the slightest attempt to understand and apply the philosophical use of language in its own intentionality, and they persist in a naïvely uncritical view of their own empirical science, which they simply take for granted as God’s truth, without acknowledging its ephemeral and provisional nature. Sokal’s post-structuralist reading of modern quantum physics, even if intended as a pedantic hoax, may yet turn out to contain more wisdom than its author credits himself with, and certainly more wisdom than Sokal and Bricmont’s debunking of French post-structuralist technical philosophical language. That quantum mechanics – even if philosophically appropriated beyond the physicists’ original intentions – does contain a great promise towards the elucidation of topical philosophical problems concerning boundaries and their transgression, the maintenance and fusion of identity, unity versus plurality, the mind, spirituality, corporeality etc., will be clear from my own brief exploration in chapter 7, which no doubt is also to be faulted in Sokal and Bricmont’s eyes. It is precisely the post-structuralist deconstruction of the autonomous subject, of all theoretical positions, which makes it thinkable that an idea, while being in the air and reflecting the contradictions of the age, may inadvertently flow out of the pen of a cynical author who is consciously rejecting that idea.4

These reflections on the empirical constraints on philosophy have a direct bearing on intercultural philosophy. For intercultural philosophy it is of the greatest

---

1 Sokal & Bricmont 1997. In Multatuli’s *Max Havelaar* (Multatuli 2001), the masterpiece of this leading nineteenth-century Dutch novelist, Droogstoppel is an extremely prosaic character, a merchant devoid of all feeling for poetry and for the imaginary in general.

3 Cf. van Binsbergen 1999g.

4 This is incidentally how I came to appreciate the Egyptocentric variety of academic Afrocentrism: I cynically started to write a book-length attack of it (van Binsbergen, forthcoming (a)). Cf. below, section 15.11.
importance to realise that rendering the thought of another thinker or of a tradition of thought is an empirical activity with all attending demands of method. In connection with the literate philosophical traditions of the Ancient Near East, Islam, South Asia and East Asia, the dangers of blundering are limited, for here there exist rich local forms of philological-critical scholarship of great antiquity, and intersubjectivity between local and North Atlantic specialists can only be achieved at the price of the North Atlantic scholars living up to the high, local standards of technical competence and language mastery. This tradition of non-North Atlantic scholarship also makes it possible to expose and overcome such Eurocentric flaws as the empirical perspective directed to those parts of the world may yet contain – as is clearly manifested by the Orientalism discussion as initiated by Said. However, when we are dealing with illiterate traditions of thought, then their recording and interpretation is nothing but a specific form of ethnography. It will have to be situated against the background of the accumulated experience, comparative research and technical criticism – as well as the critique of epistemological naïveté and North Atlantic hegemony – of many thousands of ethnographers who in the course of a hundred years have occupied themselves with the empirical handiwork of ethnography. In the first instance, ethnography was nothing other than covering with text those parts of the world that had not yet produced their own text. By a process of initial avoidance of adjacent disciplines, which is characteristic of the professionalisation of a new discipline (below we shall point out the same pattern for early anthropology), the emergent fields of intercultural philosophy and African philosophy have tended to ignore this methodological heritage (i.e. their closeness to ethnography), and have even dissimulated the empirical status of their activities – perhaps not in principle, but certainly to the extent that they do not live up to the methodological responsibilities which empirical research imposes. If, nonetheless, they rush to the description of African philosophies the way these are manifest in myths, proverbs, and in the oral pronouncements of contemporary thinkers – then these intercultural and African philosophers are no more entitled to the benefit of doubt than those ethnographers who persist in their naïve empiricism.

Experienced and well-trained anthropologists, some of the calibre of Marcel Griaule and Victor Turner, made it their life’s work to record – by an analysis of myths, rituals, conflicts, depth interviews, and the practice of everyday life – African patterns of thought and their actual contents, either by an external, etic process of rendering explicit the systematics that is implicit in their hosts’ patterns of thought, or by a more emic method of faithfully recording the pronouncements of local thinkers such as Ogotomëlli (studied by Griaule) or Muchona (studied by Turner). Naturally the ethnographic methods of Griaule or Turner are not all above criticism.2

The point is, however, that intercultural philosophers, even without engaging in a methodological discussion with the work of Griaule or Turner, think they know better: Ogotoméli and Muchona would then be denied the status of ‘real’ ‘sages’, while the institution of ‘the sage’ would yet be claimed to occur throughout Africa, but unfortunately unnoticed by all those anthropologists, who inevitably are to be declared to lack all access to authentic African thought.¹

In such a denial of the potential of cultural anthropology for intercultural philosophy I see an expression – probably unintended – of essentialism and anti-empiricism, namely:

- the claim that there are specifically African essential traits
- which are inaccessible to the empirical methods of North Atlantic social sciences
- which only Africans are capable of understanding and articulating
- whose only trustworthy guardians are the exponents of African and intercultural philosophy,
- precisely because the latter take a distance from the canons of empirical (social) science.

I do not think that, in the long run, such an attitude renders a service to Africans. Africa, which has produced humankind and which via Ancient Egypt has made a very great contribution to North Atlantic civilisation, will easily survive the encounter with empirical science – with this proviso that this should not remain a form of science imported straight from the North with all its naïveté and Eurocentrism, but that Africans will have to continue to explore their own specific variants of empirical research and its methodological canons.

Instead of a rejection of empirical methods in their own practice, and in that of other sciences, the anti-empiricist rhetoric among philosophers often takes a different form: that of the careless or ignorant dissimulation of the formidable methodological requirements of valid empirical knowledge production. Thus the appeal to empirical knowledge in philosophical discourse often amounts to statements that are passable at the level of collective representations, but that are insufficiently precise and comprehensive to pass as scientifically grounded renditions of the empirical reality to which the appeal is being made. In regard to such self-evidences as philosophers may claim, essential elements remain out of sight or are swept under the carpet: method, intersubjectivity, the cultural and political over-determination of such self-evidences; thus the value of their arguments is greatly reduced. It characterises intercultural philosophy as a young branch of science that such self-evidences abound there; the habitual approach, in those circles, in terms of a plurality of holistically conceived ‘cultures’ is a case in point.

¹ d’Arou 1956; Sarevskaja 1963; the most dismissive reinterpretation of Griaule in the 1990s has been Wouter van Beek’s in Current Anthropology (van Beek 1991).

1 Kimmerle 1997; Odera Oruka 1990b.
Even more of a short-cut available to philosophers in their avoidance of an explicitly empirical methodology, is what I might call canonical botanising. Here the argument proceeds, from the enunciation of a certain phenomenon, not to the painstaking exploration of that phenomenon with the aid of such empirical research as is usually abundantly available, but to the classification of the phenomenon in question in terms of a certain passage in the work of a canonised Great Philosopher—after which the discussion is dominated by the interpretation of that one passage, as if that would sufficiently underpin such self-evidences as have been claimed in the first place. *Autos efa*, ‘He [Pythagoras] said so himself’, was the stopgap by which the Pythagoreans lent unassailable authority to their own pronouncements; but in the process they reduced their richly inspiring philosophy to a mystery cult.

An example is Derrida’s claim1 to the effect that writing precedes the oral expression, since anything which may be conducive to inscription, from the earliest prehistory of humankind, is already to be defined as writing: a deliberately snapped twig on a branch, a line drawn with the finger in the sand. The deceptive nature of such an argument, if taken literally, does not per se lie in the use of the term ‘writing’—for one might put oneself on a nominalistic standpoint and accordingly choose one’s definition freely. However, by adopting the contrast between writing and orality, unmistakably conceptual continuity is suggested with the usual definition of writing in the empirical sciences. And from that perspective Derrida’s position is absurd. The origin and the oldest forms of writing are well documented; they have been the subject of hundreds of highly scholarly empirical publications.2 In this literature we have seen the growth of a consensus as to what constitutes writing, on the basis of a careful weighing of the empirical evidence against the background of progressive theoretical sophistication. This consensus defines a full script as a system consisting of a finite number of arbitrary, fixed, mutually distinctive and for that very reason mutually related visual elements, which are being used productively (i.e. that an infinite number of combinations may be generated on the basis of a finite number of systematic rules and elements), in such a way that all speech sounds of the specific languages for whose rendering the script is being used may be represented (more or less adequately) in that script. Such a script represents neither objects, nor ideas, but simply spoken words. In the history of humankind, full writing in this sense has been attested only from the late fourth millennium before the common era, notably from Sumer, Elam and Egypt. Far more limited precursors of full writing, in the form of pictograms and ideograms, are up to ten thousand years older and go back to the Upper Palaeolithic. Against the background of this empirical tradition, it is ridiculously anachronistic to speak of script and writing for

---

1 Derrida 1967a. My administration for other aspects of Derrida’s thought will be clear throughout this book.
the preceding three million years of human history. If we throw overboard the specific characteristics of full writing we can no longer explain the enormous influence that full writing has had on religion, philosophy, science, literature, state formation, law. It is typical of the procedure of canonical botanising that – in favour of one passage from a Great Philosopher – it feels it can ignore the entire, empirically grounded, literature on writing and on the distinctions between types of writing and their implications. Are we not being condescending towards Africans when we pretend that, according to some twisted and indefensible definition, they yet turn out to have writing after all, as if not having writing is the greatest, most dehumanising disaster that could possibly happen to a person or to a people? Is such an attitude not somewhat ethnocentric? Strangely, the more usual definitions of writing allow the African continent (and not just Ancient Egypt) a much more prominent place in the history and distribution of writing than is generally acknowledged. My worry here is not, of course, that apparently undeservingly global recognition would be given to unwritten African traditions of thought. For it has been my life’s work as a literary writer, anthropologist, Southern African diviner-priest-therapist (sangoma), and intercultural philosopher, to further precisely such recognition. No, my worry is that intercultural philosophers (without explicit adequate empirical methods, and insufficiently aware of their own personal problematic of transference, nostalgia and vicarious projection even though these makes them distort the African material) would claim to mediate African traditions whereas in fact all they are representing is figments of these philosophers’ imagination, fed by the North Atlantic philosophical tradition and not by an intimate knowledge of varieties of illiterate and orality-based African life.

If intercultural philosophers entrench themselves in a concept of ‘culture’ that stipulates a countable plurality of holistic ‘cultures’, and if they approach the empirical dimension of the rendering of other traditions of thought as if no sound methods have been worked out for such a task, then we have no choice but to remind them of contemporary empirical insights in ‘culture’ and identity, even despite all reservations we have vis-à-vis the empirical sciences for their implicitly naïve and hegemonic nature.

15.7. Globalisation and ethnicity

15.7.1. Nkoya ethnic identity

For myself, the awareness that ‘cultures do not exist’ emerged during fieldwork in the Zambian capital of Lusaka in the early 1970s. Here the Nkoya ethnic group constituted a small minority of at most a thousand people, who by means of

---

1 I am not speaking as an outsider to this field of study; cf. van Binsbergen 1997c, 1997g; and forthcoming (b).

2 Cf. van Binsbergen 1997c.
collective rituals (girls’ puberty ceremonies, possession cults, and funerary ceremonies) managed to maintain a considerable amount of mutual contact and continuity with the cultural practices of their distant home in the Zambian countryside. One night I visited a puberty ceremony, as I did so often in those days. While I danced around with the crowd and joined in the singing, I was addressed by a Black middle-aged man, meticulously dressed in a smart chalk-stripe three-piece suit, who despite his corpulence and his game leg made fierce attempts to keep up with the dancing rhythm. He said, in inimitable Zambian English:

‘Yesseh Bwana, diiss issu dawaa twadisyona kawatyaaw’ – ‘You see now, Boss, this is our traditional culture’.

Taken-for granted cultural identity but also alienation, performativity (consciously playing a role with deliberately sought-after effect), and commodification of ‘culture’ – all united in one person.

In the next quarter of a century I became more and more familiar with the religion and the kingship of the Nkoya, and I ended up as the adopted son of Mwene Kahare Kabambi, one of the kings of this people. This was the context in which, from 1988, I applied myself to the study of cultural globalisation among the Nkoya in the rural areas, especially the way in which a formal organisation (the Kazanga Cultural Association, an ethnic association articulating Nkoya ethnic identity, and largely administered by successful urban migrants) managed to select and transform the local music and dance into an annual ethnic festival, a programmed and carefully orchestrated performance named Kazanga. Since 1988, time-honoured genres of local music1 and dance have been emphatically performed in a format adopted from North Atlantic examples, and before an audience of national-level politicians and other outsiders. The performative nature of this new form of cultural production in the context of the Kazanga festival turned out to be closely related to commodification: in former times this symbolic production had, for the participants, always derived its self-evident value from the cosmology and the temporal rhythm (in annual seasonal cycles, personal life cycles, and the rise and decline of communities, headmanship and kingships) of the local rural community, but now this value has been dissociated from the local and has become a commodity, part of the strategies by which means regional elites seek to acquire power and wealth.

Ethnic articulation with performative and commodified methods, such as in Kazanga, situates itself in an increasingly politicised space, in which the local cultural orientations have lost their self-evidence by the confrontation with local and global alternative forms of expression, organisation and identity. We would remain absolutely incapable of understanding these processes if we continue to insist on a model of the plurality of distinct, complete ‘cultures’ existing side by side. Instead,

the contemporary social science of Africa presents the following discourse on ethnicity.

15.7.2. The discourse on ethnicity in African studies today

One of the most inveterate popular misconceptions concerning Africa today is the idea that the population of that continent would, in the first place, have to be classified into a large number of ‘tribes’; each tribe would be characterised by its own ‘culture’, art, language, somatic features, political organisation, including ‘tribal chief’, and its own ‘tribal homeland’ or ‘tribal territory’; the latter would cause the African continent to be a large patchwork quilt of adjacent, non-overlapping, fixed ‘tribal areas’, between which ‘tribal wars’ are postulated to go back to remote antiquity.

The tribal model for Africa has sprung from a number of sources, most of which have to be situated not in Africa itself but in the North Atlantic region:

• the preference of colonial governments for clear-cut administrative divisions each coinciding with mutually exclusive territories in the landscape;
• the preference of colonial governments for a model of inexpensive indirect administration, that assumed the existence, in the landscape, of local, indigenous administrative territories coinciding with colonial territorial divisions;
• European views concerning the coincidence of ‘culture’, language, territory and the state – the early modern, particularly Romantic origin of nation formation in Europe;
• the rationalising need, not only among colonial governments but also among industrial enterprises, among the Christian missions, and gradually also among Africans, to label unequivocally the multitude of cultural and linguistic identities at the local, regional and national level;
• while the above factors led to the crystallisation of clear-cut classifications of the African population – mainly on a territorial basis – also African leaders (traditional chiefs involved in indirect rule, early converts to world religions, incipient intellectuals and politicians) seized the opportunity to transform these new labels and classifications into self-conscious units (‘tribes’, ‘ethnic groups’) and to claim, for these units, an identity, a ‘culture’, of their own (although this usually only amounted to the selection of a few distinctive cultural features as boundary markers), and a history of their own; this process is known as ethnicisation;
• in the absence of other social and religious distinctions, these ethnic classifications, and the local and regional contradictions they suggested by virtue of their being bound to a territory, became the incentives for group formation and for competition in national politics;
• formal politics along ethnic and regional lines also led to networks of patronage along which the elites, in exchange for political support, could offer specific advantages to their ethnic and regional followers; the latter had all the more need
Chapter 15

for these advantages given the increasing failure of the formal institutions of the post-colonial state;

• even so, ethnicity in contemporary Africa retained a situational nature: some situations are far more ethnically marked than others; an increasing number of situations are, by the people involved in them, primarily constructed in terms of identities other than the ethnic identity, notably in terms of religion, gender, class, professional group, national state. Also, it frequently occurs that people in situations that are emphatically ethnically marked (such as migrants in the ethnically heterogeneous context of the modern city) operate alternately, and with success, in more than one ethnic identity. Or one sheds, at a given moment in life, the ethnic identity that one has had from birth – exchanging this identity either for another ethnic identity that has greater prestige or which represents a local majority. Finally, people may opt for a different, more universalist kind of identity (for example Muslim, or socialist) in the light of which the particularist ethnic identity becomes irrelevant. Here, a central thesis of contemporary ethnicity research meets the post-structuralist philosophy of Derrida: the idea of the self as forming a unity onto its own, is only a myth.1

This raises the question as to the existence and nature of pre-colonial identities in Africa. In pre-colonial Africa a great diversity of languages, cultural customs, modes of production, systems of domination, and somatic traits could be discerned. Along each of these cross-cutting dimensions, identities (in the sense of named categories) may be defined in local contexts. These categories often had a perspectival nature: one could speak of ‘the northerners’, ‘the forest dwellers’, ‘those who seek to dissociate from the state’, depending on the opposite position occupied by the speaker himself. Many ethnonyms are rooted in the freezing and fossilisation of such perspectival designations, e.g. in Western Zambia: Mbwela (‘Northerners’), Nkoya (‘forest dwellers’), Tonga (‘shunning state control’; also the designation of four other groups in South Central Africa), and Kwanga (‘tired of the state’). But in other cases the designations derived from localised clans, which furthered the essentialist suggestion of a fixed, somatically anchored identity acquired by descent from a common ancestor. Pre-colonial states, such as occurred on a grand scale in Africa across several millennia, always displayed a plurality of languages, cultural orientations, modes of production, somatic features, and, besides the statal forms of domination, they tended to incorporate loosely such local forms of authority (authority within kin groups, territorial groups, cults, guilds, gender organisations) as constituted organisational alternatives to statehood. Not so much control over demarcated territories, but control over people (by means of courts of law, and the extraction of tribute in the form of produce and people), was the central theme of these states. Therefore pre-colonial boundaries must be conceived of in terms of areas of overlapping spheres of influence, and not as lines on a map.

1 Derrida 1972.
It has been amply demonstrated that many colonial and pre-colonial ethnic designations in Africa have no roots in the pre-colonial past, and therefore must be very recent. The nomenclature of colonial and post-colonial identities in Africa derived to a limited extent from the extensive and complex repertoire of pre-colonial identities. However, it would be totally erroneous to claim (as African ethnic ideologues, Western journalists, and a declining number of researchers would do) that twentieth-century ethnicity in the African continent has merely been a continuation of pre-colonial patterns of group formation and group conflict. The above listed characteristics of twentieth-century ethnicity hardly obtained before the colonial state had established itself with its bureaucratic, named territorial divisions.

In the contemporary ideological construction of Africa by intellectuals, politicians and in the media both in Africa and in the North Atlantic region, as well as in the daily societal practice of many Africans themselves, ethnicity is to a large extent conceived as holistic and as bundled: language, cultural customs, modes of production, somatic features, territory, political leadership are then assumed to form one integrated package in such a way that a person’s ethnic identity (that person’s ‘culture’) is claimed to determine the total mode of being of that person. Such bundling is a direct reproduction of the bureaucratic rationality that forms the framework for the political in postmodern North Atlantic society. The various cultural orientations involved in a local situation are hierarchically ordered in such a way that one cultural orientation is privileged above the others, is essentialised, and is considered to be eminently constitutive for one person or for one group; this is the cultural orientation that is subsequently stressed as a result of public mediation. Thus ‘culture’ functions primarily as a performative boundary marker. By contrast, it was characteristic of pre-colonial identities that the various dimensions along which they could be defined remained detached from one another, were not mutually integrated, and as a result no single identity was capable of developing into a claim of totality that was publicly mediated. Instead the various identities within a region criss-crossed in a gaudy confusion.

All this allows us to understand why in their own personal vision of social life, many Africans have come to consider as an unshakeable reality the very tribal model that professional Africanists are rejecting today. Politicians can appeal to this reified and distorted image of social reality in order to lend an ethnic dimension to economic and political contradictions, thus essentialising these contradictions.

Given these historical and political backgrounds, it is difficult to offer a useful definition of ethnicity. However, the following is an attempt in that direction. Ethnicity is the way in which wider social processes have been economically, politically and culturally structured under reference to a plurality of ethnic groups that are distinguished and named within the collective space. A recognised ethnicity is not ‘a culture’, and a national or international political system is not an ‘arena of cultures’. An ethnic group is nothing but an explicitly named set of people within a societal system of the classification and ranking of groups. Within the social field
(for example a society, a nation state) one distinguishes collectively a limited number of such named sets of people, always more than just one. Membership of such a set is considered to be acquired by birth and hence is in principle immutable, but in fact the acquisition of a new ethnic identity later in life is a common occurrence. Invariably more than one identity is invested in one person at the same time. Within each set of people, the members identify with one another, and are identified by others, on the grounds of a number of historically determined and historically mutable, specific ethnic boundary markers: the ethnic name itself, and moreover, for example, language, forms of leadership, modes of production, other distinctive cultural features, occasionally also somatic features. The ethnic groups that exist within one country often differ from each other only with respect to a very limited selection of cultural features functioning as boundary markers.

Concretely this means the following. From a Nkoya village in the heartland of Zambia one may trek (partly on the trail of David Livingstone in the middle of the 19th century CE) five hundred kilometres towards the north, east, west and south without noticing remarkable changes in the cultural, man-made landscape (the villages, the royal courts, the fields, the pastures, the fishing grounds, the hunting groups, shrines, and also ideas about kinship, law, witchcraft, adulthood, kingship, birth, maturation and dead, the world, life after death, God); on one’s journey one traverses a large number of so-called ‘tribal areas’ and language areas such as used to be distinguished in the colonial period. And whereas most local inhabitants will turn out to be multilingual, and while the languages of the Bantu linguistic family appear similar, as do Dutch, German and Swedish, after a few hundred kilometres one can no longer effectively communicate using the Nkoya language – but this will only be the case hundreds of kilometres after one has effectively left behind the recognised ‘Nkoya tribal area’ as defined in colonial times.

The great regional continuity of cultural orientations, in western Zambia as elsewhere in Africa, is an empirical fact; in a process of essentialisation, ethnonyms and other aspects of ethnicisation have imposed deceptive boundaries upon this continuity – more or less in the way one cuts out nicely shaped biscuits with a biscuit mould, from a large rolled out slab of dough that has virtually the same constitution throughout.

15.8. Beyond ethnography

In my opinion, the contemporary anthropological discourse on African ethnicity, cultural diversity and cultural continuity contains the best possible arguments for my thesis that ‘cultures do not exist’; these arguments are largely based on empirical ethnographic research. Therefore, let us stay a while with ethnography as a specific form of intercultural knowledge production.

The ethnographer situates her pronouncements in a social process, in the encounter and dialogue\(^1\) between the ethnographer and the people she is writing about. This lends to ethnographic texts a character of their own, an anecdotal narrative accent that is often subversive vis-à-vis the quest for discursive appropriation, consistence, the imposition of sharp conceptual boundaries, and other similar types of ordering that tend to be characteristic of North Atlantic philosophical texts. Moreover, despite the great investment the cultural anthropologist has made towards mastering the local language, she does realise, as no other, that a large part of human manifestations is not framed in language and can hardly be expressed in language. Although ultimately anthropology is geared to the reduction of a large variety of human manifestations including non-language ones, to text, anthropology tends to the insight that language, although of unmistakable structuring potential, does not ultimately and totally determine the cultural domain, nor the full range of human cognition.

Profoundly inherent to anthropology is a recognition of the performative side of human behaviour. In the anthropological discipline the concepts of ‘role’ and ‘role play’ have turned out to be eminently successful as devices to link the individual and the social. The anthropologist realises that man shapes his social mode of existence by playing a role, with a very great degree of personal interpretation on the part of the role player, by loosely interpreting a social script, and not by the mechanical acting out of a fully determined, tightly programmed cultural inscription. Moreover the entire idea of the acquisition of cultural competence by means of participant observation is based on the notion of play: to the best of her ability the fieldworker plays, not the role of foreign researcher (for that role scarcely exists as an \textit{emic} concept in most social contexts worldwide), but a number of roles that are being recognised and defined within the local society (friend, guest, kinswoman, lover, patron, client), and she tries to bend these roles so that they are not merely locally recognisable, but also instrumental for the main goal of her local residence in the host society: for the collection of information.

Even although she will occasionally have great doubt on this point, both in the field and during writing up, the ethnographer in principle takes for granted her capability of getting to know, through prolonged participant interaction, one of more cultural orientations from the inside and in their specific systematics. She also takes for granted that in this way she will ultimately be able to produce, by herself, forms of local overt behaviour that the original participants will recognise as more or less competent according to the local model. This production of local overt behaviour is increasingly competent (as it is constantly subjected to the participants’ sanctions through their gaze, rejection, ridicule, encouragement). In the anthropologist’s publicly displayed behaviour in the field, (her understanding of) the local model is articulated and made manifest much more directly and unmistakably than in the most dextrous interviews. For the anthropologist, participation is not only a source of

\(^1\) Cf. Dwyer 1977.
primary information through observations and interviews, and not just a means to lower thresholds of communication by generating trust and demonstrating humility, it is the constant practical test of whether the anthropologist can apply in concrete situations, and under pressure, the local knowledge which she has gained in interviews and observation.

In the context of anthropological fieldwork as a knowledge acquiring practice, the term ‘participation’ has a totally different meaning from that which philosophers derive from the work of the French ethnologist Lévy-Bruhl\(^1\) – for many philosophers their principal source of a furtive conceptualisation of humanity outside the North Atlantic region. For Lévy-Bruhl, who worked in the first half of the twentieth century, participation was a specific form of incomplete, diffuse and porous subjectivity allegedly characterising so-called ‘non-Western’ or – as one preferred to say then – ‘primitive’ man – a model of experience according to which the human subject does not juxtapose himself vis-à-vis the surrounding nature and society, but largely merges into them. By the same token, such juxtaposition was supposed to be characteristic of the logical rationality of the North Atlantic subject under the habitual conditions of modernity.

Anthropological participation in the context of fieldwork has a unique function of validation. Let us take as an example the learning of a foreign language though total immersion. Someone involved in such a process will produce speech acts, will submit these to native speakers for criticism and correction, and will thus gauge and improve his own skill in the local language. In the same (and overlapping) way participant observation furnishes a practical feedback to the implicit and explicit insights that a fieldworker may have gathered earlier in the same research through observation and conversations. Participating is, in the first instance, not an expression of exotism, not a form of going native or of risky loss of self, but simply an inductive and hence evidently incomplete form of empirical proof of a practical, interactive and reflective nature. If the fieldworker has actually arrived at some real knowledge and understanding of local cultural forms, then she is rewarded by the participants’ affirmative attitude and an increased flow of subsequent information; and in the opposite case she is punished by the participants’ rejection and a decrease in the subsequent flow of information. The more the fieldworker is defenceless, the more devoid of North Atlantic hegemonic protection, the more isolated from her home background, the stronger the social control that the participants can exert on her, and the more massive the flow of information and the greater, ultimately (provided the fieldworker can retain or regain her professional distance), the knowledge and insight gathered during fieldwork.

Moreover, knowledge production in participatory fieldwork takes place on both

\(^1\) Lévy-Bruhl 1910, 1922, 1927, 1952.
verbal and non-verbal levels, leading to the ethnographer’s textual renderings of the participants’ own texts, as well as to the ethnographer’s textual renderings of observations of non-verbal behaviour. Because of this much wider, non-verbal basis, firmly rooted in participation, the knowledge acquired in fieldwork derives from experience (often, as Parts II and III indicate, a profound and distressing experience) in ways that have scarcely parallels in the procedures of intercultural knowledge production so far pioneered by intercultural philosophers – unless the latter do fieldwork among ‘sages’, but then their techniques of elicitation and recording are often hopelessly defective.

Therefore, whatever may be theoretically wrong with fieldwork as a method for the production of intercultural knowledge, it appears to be in principle far superior to the forms of intercultural knowledge of philosophers, who tend to rely on texts, and usually on translated texts from foreign languages at that; I say ‘in principle’, because below I shall argue that this empirical advantage is largely forfeited by the epistemological naïvety of anthropologists as compared to professional philosophers.

The role of researcher forces the anthropologist to adopt distance and instrumentality vis-à-vis the participants and their cultural orientations, but at the same time the internalisation of local cultural orientations works in exactly the opposite direction. Ethnographic fieldwork is a play of seducing and being seduced. It constantly suggests the possibility of such a boundary-crossing as the fieldworker desires, and in this suggestion the boundary between researcher and the researched, is not so much denied or perceived, but constructed in the first place. The researcher seeks to be seduced towards participation and knowledge; but the hosts also, in their turn, seduce through word and gesture in order to constantly shift and reduce the boundaries of access, knowledge, trust and intimacy around which every anthropological fieldwork revolves.

In playing the game of fieldwork, is the ethnographer the lover or beloved par excellence of the society under study, or the cynical manipulator – or both? This question has occasionally been asked within the anthropological discipline. But it addresses the foundation of that discipline to such an extent that it cannot be answered from within the confines of anthropology itself. Of old, the investigation of foundations has been shunned by anthropologists – complacently they are satisfied with their naïve empiricism. Anthropologists manage to do their work in fieldwork locations that tend to be distant and inhospitable, and here they think up spartan alternatives for the standard North Atlantic comforts that are temporarily denied to them. By the same token, they are inclined to improvise their way when it comes to epistemological and methodological foundations, thinking up their own solutions

2 Cf. the exchange between Wolf Bleek (= Sjaak van der Geest) and myself in Human Organization (Bleek 1979; van Binsbergen 1979b) and van Binsbergen 1986-87.
and, if they seek help in the process, limiting their search to the writings of fellow anthropologists. But often this does not yield enough.

In view of the reputation (as being highly philosophical) of Johannes Fabian’s seminal book *Time and the Other: How Anthropology Makes Its Object*, I was surprised to see, upon a recent re-reading, that its explicit philosophical references are in fact virtually limited to Baudrillard, Foucault, Hobbes, Ricoeur and Schutz. Another explicitly philosophically orientated book written by an anthropologist, that by my late friend and colleague Peter Kloos on the philosophy of anthropology, deals with only an odd selection of philosophical problems in anthropology: the Popperian and logical positivist underpinning – not of fieldwork-based ethnography on one community (which is by far the most standard form of anthropological knowledge production) but of comparative anthropology (i.e. cross-cultural studies). Of fieldwork, mainly the ethical problems of fieldwork in unmistakably imperialist situations are treated. Even so, Fabian and Kloos display a philosophical competence that is absolutely exceptional among anthropologists in Dutch-language environments, with the exception of such (post)Roman Catholic fortresses as Nijmegen and Louvain, full of (mainly ex-) priests and ex-students for the priesthood, whose standard stock-in-trade has been a decent two-years’ philosophical training in the Netherlands, although this situation is about to change. In French, German and American cultural anthropology, incidental reference to contemporary philosophy is rather more usual and is beginning to become fashionable; but even there it is rare to find specific studies exploring the relationship between both disciplines.

Used to roughing it under fieldwork conditions, anthropologists hate to throw away something that may yet come in handy. At the present moment, when philosophy has virtually turned away from the concept of the autonomous subject and from body/mind dualism as two major pillars of modernity, we witness how the autonomous subject, acting consciously and constructing his world on that basis, settles comfortably as the central point of departure of mainstream anthropology – where transactionalist actor approaches on the basis of methodological individualism have been popular since the 1960s; since the end of the 1980s this paradigm has gained massive political support in that the concept of the market as a maximalising strategy has become the ideological keynote of North Atlantic society. At the present moment when post-structuralist (which often comes down to: anti-structuralist) approaches, with considerable delay, seep into anthropology, the structuralist method

1 Fabian 1983. By a remarkable coincidence, Fabian’s title is identical to that of a book published by Levinas in the same year in French. Levinas does not play a role in Fabian’s argument; cf. Levinas 1983.

for the analysis of myths and rites turns out, nonetheless, to have installed itself among the standard professional analytical toolkit of the anthropologist. In the same vein, neo-Marxism as an all-encompassing anthropological paradigm of the 1970s has by far been left behind today, but what has remained, also as part of the lasting toolkit of the anthropologist, is the model of the articulation of modes of production, that could not have been formulated but for Marx’s work on the Asiatic mode of production and on other non-Western societies. Used to dissimulate the contradictions of intercultural mediation or to encapsulate these contradictions in what would appear to be personal idiosyncracies (cf. my own sangomahood as discussed in Part III), rather than to think them through in general analytical terms, anthropologists evidently do not aspire to systematic consistency. In practice they are arch-eclectics.

Philosophers are infinitely more sophisticated on these points. From their self-image composed of intellectual passion, broad intellectual exchange, interdisciplinarity, and their intimate knowledge of the intellectual genealogies of concepts and schools of thought, they can scarcely imagine the specific dynamics of cultural anthropology as a discipline where the echoes of the wider intellectual climate of our time are heard only with great retardation, at the cost of considerable intra-disciplinary resistance, and often deformed beyond recognition. For instance, the Nietzschean distinction between Apollonian and Dionysian was appropriated by Ruth Benedict in her popular introductory work *Patterns of Culture*, half a century later. The critique of anthropology for being imperialist (early 1970s) arose in the aftermath of the anti-imperialism permeating the left-wing intellectual and philosophical climate in continental Europe during the 1950s and 1960s. Likewise, we have seen the rise of post-structuralist and postmodern anthropology, a few decades after postmodernism was the intellectual fashion in architecture, literature and philosophy. A nice example of oblique anthropological philosophising is also the book *Culture and Practical Reason* by Marshall Sahlins, who for years was leader of one of the world’s most renowned departments of anthropology, that at the University of Chicago. For any philosopher Sahlins’ title would, in the first place, refer to Kant; however, Sahlins’ approach has nothing whatsoever to do with Kant – there is a deliberate non-reference.

Only once or twice did anthropology manage to take the initiative in the definition of the wider intellectual climate – notably in the rise of the concept of ‘culture’, and in Lévi-Strauss’s version of structuralism (which however, as is generally known, was amply prepared for by linguistic, sociological and psychoanalytic developments in the late nineteenth and early twentieth century).

2 Sahlins 1976.
3 Kant 1983c (*Kritik der Reinen Vernunft*, 1781/1787).
4 Cf. Drechsel 1984.
Hardly any traces can be found today of what was Wittgenstein’s gift to anthropology: the promising discussion, as from the late 1950s, of rationality, magic, and the recognition of the truth problem such as is posed by the belief systems of cultural orientations different from one’s own.1 Selected anthropologists did realise that the phenomenological and hermeneutical approaches in philosophy are extraordinarily well suited for the problematisation of the cultural practices of others both within and outside one’s own society; however, once these approaches have been introduced into anthropology (by Geertz, among others) they have been localised and canonised there, and few anthropologists still reach for the original phenomenological texts. In Geertz’s approach the distinction between ‘thick’ and ‘thin’ description correspond with that between *emic* and *etic*. Geertz has rendered anthropology a somewhat doubtful service by adapting Ricoeur’s phenomenological hermeneutics to what Geertz thought were the requirements of ethnography.2 It amounted to a major *coup de force*: notably, the decision to consider as *texts* all the pluriform events – including non-language ones – that lend themselves to ethnographic description. A quarter of a century later – under the influence of the further elaboration of textual theories in literature science – this conception has led, among a minority of anthropologists, to a hermetic view of the ethnographic corpus as complete, introverted, and as detached from the dynamics of social relationships in the social domain that is situated around that corpus and to which that corpus refers in important ways.3

If phenomenology only found its way into anthropology at considerable costs and with considerable delay, the development of an anthropological discourse based on Foucault is today – one and a half decades after Foucault’s death – becoming a respectable anthropological pastime.4 The anthropological reception of Kristeva, Deleuze and Guattari is still in its infancy.

Postmodernism only reached anthropology by the late 1980s.5 Never has there been so much discussion of modernity in anthropology as in the last few years, often in terms of modernity being a condition that, although still highly coveted among our African subjects of inquiry, has already passed, has already lost its magical appeal, has already been overtaken by postmodernity, among North Atlantic anthropologists themselves in their personal lives as well as in their writings. This does not take

---

1 Cf. the above footnote on the discussion initiated by Winch (section 15.3.4); as is clear from the extensive list of references there, that discussion – however shunned by most contemporary anthropologists – has become a fixed point of orientation within African philosophy.

3 For a regrettable, though by its own standards impressive, example of such an approach to ethnography, cf. Drews 1995.

4 For instance, the work, very influential in contemporary anthropology, by Jean Comaroff and John Comaroff, 1991-97. This does not take away the fact that Foucault had already been signalled much earlier by a handful of anthropologists such as Rabinow and Clifford, as well as by the anthropologically-inclined literature scholar *cum* philosopher Mudimbe.

away the fact that the majority of anthropologists have tacitly taken a curious position in the debate on modernity and postmodernity. For the ethnographer is, on the one hand – the postmodern aspect – the champion of the specific, the local, and the vernacular (the *emic* side); but, on the other hand, this often serves as merely a stepping-stone towards something else: towards an attempt to search – and this is the typically modernist aspect of the ethnographic practice – in the local for subsequent generalisations that transcend the local context. This search is informed by the construction of the publishable ethnographic text, and by the general anthropological concepts and theories that feature in such a text as a wider framework (the *etic* side). In this way the specific, local and vernacular is on the one hand – after postmodern fashion – claimed to be ‘other’ in a unique way that does not allow a relative view; but, on the other hand, that very same local aspect is – after modernist fashion – dragged along to a dialectics that subsumes that otherness as part of a larger whole, a no-longer-other, an Other reduced to sameness. The anthropologist balances between modernity and postmodernity, in an inimitable circus act that philosophers can very well deconstruct but that they would scarcely feel tempted to emulate.

An important factor in the relative intellectual isolation of the anthropological discipline has been the fact that that discipline has also attracted a remarkable number of outsiders: Jews, women, homosexuals, working-class children like myself, migrants, and moreover the spiritual heirs of the explorers, big-game hunters and missionaries of the nineteenth century – so many people who were less welcome in the more established academic disciplines, or who could not take root there. Moreover we can point to a process of professionalisation that has persisted throughout the twentieth century and that brought about the tendency for anthropologists and other social scientists preferably to dissociate themselves from, and antagonise, the very fields of scholarship with which they would have the greatest affinity in terms of problematic and method: philosophical anthropology, history, classics, comparative legal studies, comparative religious studies, linguistics. Instead, anthropologists and their fellow social scientists sought counsel with the natural sciences and the latter’s methodologies and epistemologies. As a result a superficial scientism is often the only, obsolete, philosophical baggage of anthropologists. Besides, many anthropologists combine a rigid orientation towards societies outside the North Atlantic region with myopia, not to say contempt, vis-à-vis the social, political and intellectual current events taking place in their own social, political and academic surroundings beyond anthropology proper.

For decades the distinction between *emic* and *etic* has been one of the most powerful tools among cultural anthropologists in order to define and approach their knowledge object and the procedures of their knowledge construction. A few years ago the leading logician Quine gave his philosophical *nihilo stat* to the paired concepts. Yet the distinction, however useful, may easily be criticised. It is cast in the form of a binary opposition, which also provides the standard framework for

---

1 Quine 1990a.
Lévi-Strauss’s structuralism, and implausibility of which as a basic unit of culture has been argued in that context. Bhabha demonstrates (in a way inspired by Derrida’s deconstruction of binary oppositions) that colonial practice took shape, not so much by virtue of the binary oppositions that were imposed by the colonial rulers, but by the fuzzy, inconsistent ways in which these binary oppositions were in fact applied.1 The distinction moreover posits a modernist juxtaposition between knowing subject (the ethnographer) and known object (the participants, their conscious cultural orientation, and, beyond that, the underlying postulated reality as reconstructed by the ethnographer). Thus the distinction raises fundamental political and ethical questions concerning the subordinating, even dehumanising nature of the Other’s analytical (etic) gaze.2 Our judgement of the distinction cannot be detached from the debate concerning the controversial claim3 of access to a privileged meta-position where an analyst (for example the ethnographer) pretends to escape from her own social and cultural determination, as well as from the intercontinental hegemonic structures of domination. Here we had better remind ourselves that what we intend as etic (as analytical, as meta-cultural) in all probability merely amounts to our own local emic raised to an undeserved status of universality and cultural neutrality. Notably, the etic perspective is opposed to a dialogical, intersubjective (in the sense of: between fieldworker and local participants), emic perspective of knowledge production, such as is being preferred today. On the other hand, the etic approach is in line with another and equally cherished ideal of knowledge production: it is boundary-effacing in this respect that it allows us (not only the ethnographer and the international academic community, but also the local bearers of the cultural orientation under study) to liberate ourselves from the chains of collective positions that have once been adopted and that are being mediated by the emic approach.4 In other words, to the extent to which the emic approach mediates the collective representations of others, to that extent the etic approach may be said to liberate us from such (inevitably parochial, local, particularistic) collective representations, thus opening up space for our own properly scientific explorations that tend to universality and that should strive to be as free as possible from local collective representations including our own. Moreover the etic approach reminds us of the unintended and unpredicted effects of socio-cultural arrangements – social implications of which the actors cannot possibly be conscious and which therefore

1 Bhabha 1986; Young 1995.  
2 Sartre 1943; Luijpen 1980: 280f. The danger of reduction of the other to self is also a recurrent theme in Levinas’ work, cf. Levinas 1972, 1983; Becker 1981; Bernasconi 1986.  
3 For a Foucaultian critique of this illusion, based on the concept of genealogy (which is ultimately Nietzschean), see: Rabinow 1984; Foucault 1977. Cf. also Kimmerle 1985; and: Nietzsche 1887. The impossibility of an epistemological Archimedean point is also argued in: Rorty 1979; and from a totally different point of view in: Putnam, 1978, 1981. Such impossibility, in other words, is a received idea in contemporary philosophy.  
cannot be approached from an *emic* perspective.1 Because of its distancing from the local cultural specificity to which only the fieldworker herself has scientific access, it is precisely the *etic* perspective that promises to provide a solution with regard to the intradisciplinary intersubjectivity in intercultural knowledge production. All in all, the distinction *emic/etic* clearly brings out the fundamental dilemmas of cultural anthropology today.

Despite the relative intellectual isolation of anthropology, we can identify in the wider philosophical climate of our time a number of developments that have greatly undermined classic anthropology in the 1970s and 1980s. The rise of an explicit discourse on alterity, in feminism, anti-colonialism and anti-racism, inevitably had a negative effect on the credibility of the anthropological project as ‘the science of the other, of other cultures’. Johannes Fabian’s book *Time and the Other* has been a major factor in introducing these critical themes into anthropology.2 This movement converged with that of postmodernism, that proclaimed the end of all Grand Narratives, thus debunking Grand Theory as a totalitarian illusion.3 Was not the Grand Narrative a strategy, not for revealing the truth, but for concealing it? Was not the great narrative of anthropology a way of speaking, not about the other, but rather about ourselves as participants, partisans, in a process of North Atlantic hegemonic intellectual and ideological subjugation of the world at large? The anti-imperialist critics of anthropology in the 1970s (Asad, Copans, Said)4 were still following a Marxist inspiration, but the post-colonial theory approach by such writers as Spivak and Rattansi5 reveals the potential also of post-structuralism/philosophy of difference for bringing out the problems of knowledge production on an intercontinental scale – notwithstanding the North Atlantic entrenchment of most post-structuralist philosophers themselves.

In the course of the last few decades this type of critique has demonstrated that cultural anthropology is so profoundly formed and informed by North Atlantic projects of domination (colonialism, imperialism, worldwide hegemony) that we can scarcely believe any more that this discipline could take a distance from these antecedents without giving up its disciplinary identity. The inequality between the ethnographer and the group under study in terms of control over the central medium (‘participant observation’ and ‘a textual ethnography’) takes care of the fact that, even with the best of intentions, deformations of representation are bound to occur. Since the production of text is ultimately a technology of human control, even the best *emic* representations are bound to be misused for intellectual domination. The ethnographer has an unshakeable belief that it is possible to report adequately on the

---

3 Lyotard 1979.
4 Asad 1973; Copans 1975; Said 1978.
knowledge acquired during fieldwork, even if this means reporting in a language that, in principle, is totally different from the one used in the original ethnographic context. The formal academic language of professional ethnography is inaccessible to most of the people whose socio-cultural practices are described in that language. Ethnographers (including those ethnographers who call themselves intercultural philosophers) can only claim credibility provided that, in their fieldwork and in the production of their published texts, ample provision\(^1\) has been made to turn their ethnography into a form of ‘communicative action’\(^2\). This requires not only that (along \textit{emic} lines) the participants’ representations and evaluations are, to the ethnographer’s personal conviction, mediated faithfully and with integrity, but also that the participants have a decisive say in this process of mediation. Only on that basis can ethnographic mediation become a form of a self-reflexive awareness-taking (\textit{prise de conscience}) that is in line with the participants’ own local cultural orientation,\(^3\) and that enables the underlying epistemological principles of that orientation to effectively fertilise, or transcend, North Atlantic empirical epistemology.

15.9. From ethnography to intercultural philosophy: Beyond the ethnographic epistemology

We are in need of an academic medium that clearly does not have such hegemonic roots as cultural anthropology; and of practitioners of that medium who, because of their background or their radical reorientation later in life, do not take part in that hegemonic process,\(^4\) or seek to disentangle themselves from it. Intercultural philosophy is a discipline attracting, among others, intellectuals from outside the North Atlantic region. To some extent, African philosophy is even reserved for Africans. Many intercultural and African philosophers conduct – often in a strongly introspective manner – ethnography on the spur of their own knowledge and understanding of one of their cultural orientations (that of their home village), against the background of their command both of their mother tongue and of an international language and idiom of academic communication. Obviously, such researchers are greatly privileged as compared to foreign ethnographers. However, even these philosophers are involved in a process of mediation that springs from the fact that, among their various cultural orientations, the cultural orientation called ‘cosmopolitan philosophy’ plays a very important role. In this situation there is a real danger of nostalgic and performative projections on their part;\(^5\) explicit empirical

\(^1\) For an example of such a strategy, cf. van Binsbergen 1992b: 58f.
\(^2\) Habermas 1982.
\(^3\) Chapters 2 and 4
\(^5\) Cf. chapter 14, where I argue this point in connection with the Southern African \textit{ubuntu} philosophy.
methods strengthening intra-disciplinary intersubjectivity are absolutely indispensable here. A profound awareness of the great challenges on this point distinguishes such cosmopolitan African philosophers as Mudimbe\(^1\) and Appiah from their essentialising predecessors of an earlier generation.

The main issue here is not a Northern hereditary burden allegedly preventing Northerners from producing valid intercultural knowledge about the South, nor a Southern birthright to a monopoly on valid knowledge production about the South, but a radical revolution in our approach to the cultural other. To the extent to which cultural anthropology has entrenched itself in the posed naïveté of an eclectic, apolitical, but fundamentally Eurocentric empiricism, it is only intercultural philosophy that may open our eyes to the epistemological implications of cultural anthropology.

In cultural anthropology statements of certain types are eligible to be assessed as true or false:

- the ethnographer’s statement to the effect that her ethnographic description of concrete *emic* details is valid
- the ethnographer’s statement to the effect that her abstract theoretical *etic* analysis is valid
- the individual informants’ statements that they render facts, representations and rules validly.

There is however a fourth type of statement that cultural anthropologists absolutely exclude from the question concerning truth:

- the participants’ statements to the effect that their collective representations are a valid description of reality (both in its sensory and in its meta-sensory aspect, visible and invisible, etc.)\(^2\)

Following the later Wittgenstein, Winch has shown us that the truth of the latter type of statement cannot be established in general and universally, but depends on the language-specific, meaning-defining form of life that is at hand. Whether in a certain society witches do or do not exist, cannot be answered with any universal statement to the effect that witches do exist, or do not exist, but can only be answered by reference to the specific forms of life at hand in that society – and of such forms of life there are always more than one at the same time and place.\(^3\) The concept of form of life has much in common with my concept of ‘cultural orientation’ (of which likewise more than one are involved in any society at the same

---

\(^2\) Cf. Lewis 1981.

\(^3\) Winch 1970: 100f; Sogolo 1993; Jarvie 1972.
time). Now, cultural relativism as a central professional point of departure of classic anthropology may perhaps imply, theoretically, that the exclusion of this fourth category originates in something as laudable as the anthropologist’s respect for whatever is true in the other form of life or cultural orientation; but in practice it nearly always comes down to following. However much the ethnographer has invested in the acquisition of linguistic and cultural knowledge so that local collective representations can be unsealed for her, and however much she gradually internalises these collective representations as a private person – yet in her professional formal utterances (in the form of academic ethnographic writing-up) she does not give the collective representations she has studied the benefit of the doubt, nor the respect she pretends to be due to the collectively other. The tacit point of departure of the cultural anthropological professional practice (and in this respect it does not distance itself from North Atlantic society as a whole) is: Collective representations of other societies under study cannot be true, unless they coincide one hundred percent with the collective representations of the researcher’s own society of origin. Of course, both the researcher’s society of origin and the cultural orientation under study construct, each in their turn and in a highly different way, a truth-creating life-world in the form of a texture of collective representations. This is a situation suggestive of a relativist approach in so far as it would by definition be impossible for us to choose between these truths on the basis of an emic perspective.

But according to the conventions of ethnography such a life-world is to be one-sidedly broken down if it is the Other’s life-world, and must be left intact if it is the researcher’s own. Just try to realise what this means for the confrontation, throughout the modern world, in institutional, political and media settings, between such major and powerful North Atlantic institutional complexes as democracy, medicine, education, Christianity, and pre-existing local alternatives in the respective fields. The anthropologist may pay lip-service to these local alternatives for humanitarian and aesthetic reasons but – for her own sanity and professional survival (not as a impassioned researcher but as a permanent member of her own home society) she has to abide by the adage that they cannot be true.¹

Born in the Netherlands (1947), I was trained at the municipal university of my home town as a social scientist specialising in the anthropology of religion. From my first fieldwork (1968), when I investigated saint worship and the ecstatic cult in rural North Africa, I have struggled with this problem of the fourth type of truth – which I am inclined to consider as the central problem of interculturality. With gusto I sacrificed to the dead saints in their graves, danced along with the ecstatic dancers, experienced the beginning of mystical ecstasy myself, built an entire network of fictive kinsmen around me. Yet in my ethnography I reduced the very same people to numerical values in a quantitative analysis, and I knew of no better way to describe their religious representations than as the denial of North Atlantic or

¹ This argument is carried forward, or so I intended, in the Introduction to this book.
Cultures do not exist: Interculturality’s exploding self-evidences

It was only twenty years later when, in the form of a novel (Een Buik Openen, i.e. Opening a Belly, published in 1988) I found the words to testify to my love for and indulgence in the North African forms of life that I had had to keep at a distance as an ethnographer and as a member of North Atlantic society. In the course of many years and of four subsequent African fieldwork locations, always operating in the religious and the therapeutic domain, I gradually began to realize that I loathed the cynical professional attitude of anthropology, and that I had increasing difficulty sustaining that attitude. My apprenticeship at the University of Zambia (1971-1974) as a young lecturer and researcher in social science in very close collaboration with such radical scholars as Jack Simons and Jaap van Velsen, in an intellectual climate consistently and incessantly preparing for the democratic liberation of South Africa (in which struggle Jack Simons and his life’s companion Ray Alexander played a major part), reinforced the radical political lessons I had received from the Asianist Wim Wertheim as a student. As a result I began to shed the blunt positivism that (under the influence of my more specifically anthropological teachers, and of my first wife who is an experimental physicist) had attended my first fieldwork. I became aware of scholarship’s political and ethical responsibilities, and of the potential humiliation and betrayal of the people under study by social researchers in the field. In subsequent years, I was to ask myself more and more the following question: Who was I that I could afford to make-believe, to pretend, on those very points that attracted the undivided serious commitment of my research participants? Several among them have played a decisive role in my life, as role models, teachers, spiritual masters, loved ones. Experiencing their religion and ritual as an idiom (a symbolic technology) of sociability which I was privileged to share, I could not forever bear the tension of joining them in the field and betraying them outside the field.

In Guinea-Bissau, in 1983, I did not remain just the observer of the oracular priests I had come to study, but I also became their patient – like almost all the native-born members of the local society were. In the town of Francistown, Botswana, from 1988, under circumstances that I have discussed in Part III – the usual form of fieldwork became so unbearable to me that I had to throw overboard all professional considerations. I became not only the patient of local diviner-priests (sangomas), but at the end of a long therapy course ended up as one of them, and thus as a socially recognised and certified believer in the local collective representations. At the time I justified this primarily as a political deed, from me as a White man in a part of Africa (Botswana’s Northeast District) that had been

1 Van Binsbergen 1980a, 1980b; 1985b, forthcoming (c).
2 Van Binsbergen 1988a.
disrupted by White monopoly capitalism and White racism. Now, more than then, I realise that it was also and primarily an epistemological position-taking – a revolt against the professional hypocrisy in which the hegemonic perspective of anthropology reveals itself. It was a position-taking that almost expelled me from cultural anthropology and that created the conditions for the step which I finally made when occupying my present chair in intercultural philosophy.

This step means a liberation, in the first place from an empirical habitus (social anthropology) that, along with existential distress, has also yielded me plenty of intellectual delight, adventure, remuneration, and honours; and, in the second place, liberation from such far-reaching spiritual dependence (as a transference-based re-enactment of infantile conflict) on my mentors and fellow cult members as originally characterised my sangomahood. Becoming a sangoma was a concrete, practical deed of transgression in answer to the contradictions of a practice of intercultural knowledge production that I had engaged in for decades, with increasing experience and success. Becoming an intercultural philosopher means a further step: one that amounts to integrating that transgressive deed in a systematic, reflective and intersubjective framework, in order to augment the anecdotal, autobiographical ‘just so’ account with theoretical analysis, and to explore the wider social, political, theoretical and epistemological relevance of an individual experience. For what is at stake here is not merely an autobiographical anecdote. If I have struggled with intercultural knowledge production, then my problem coincides with that of the modern world as a whole, where intercultural knowledge production constitutes one of the two or three greatest challenges. If it is possible for me to be, concurrently, a Botswana sangoma, a Dutch professor, husband and father, and an adoptive member of a Zambian royal family, while at the same time burdened by sacrificial obligations, cultural affinities and fictive kin relationships from North and West Africa, then this does not just say something about me – a me that is torn (but not desperately so) between various commitments, that is postmodern, boundless; one who has lost his original home but (after finding, and losing again, new physical and spiritual homes in Africa) realises that the construction of homes is as arbitrary and full of risks as it is indispensable and universal among humans (even if one may ultimately find a relatively secure home with one’s loved ones and in one’s professional practices). Provided we take the appropriate distance and apply the appropriate analytical tools, such a state of affairs in my personal life also says something about whatever ‘culture’ is and what it is not. It implies that (at least in the modern world) culture is not bounded, not tied to a place, not unique but multiple, not impossible to combine, blend and transgress, not tied to a human body, an ethnic group, a birth right. And it suggests that ultimately we are much better off as nomads between a plurality of cultures, than as self-imposed prisoners of a smug Eurocentrism (or Afrocentrism, for that matter).
15.10. From ethnography to intercultural philosophy: Long-range correspondences in space and time

In the 1990s my road from ethnographer to intercultural philosopher was to take me on a further exploration of the relativity of cultural specificity (hence by implication the deconstruction of cultural relativism). Once I had become a sangoma, I had at my disposal a fairly unique body of cultural knowledge, and a fairly unique status – the status of recognised local religious specialist; but my move to become a diviner-priest-therapist would be rendered meaningless if as a next step I merely committed this knowledge to writing in a standard ethnographic monograph, with all the distancing and subordinating objectification this entails. Nor could I bring myself to write about the details of the social and psychiatric case material that automatically came my way as the therapist of my Botswana patients. What to do? Could I find a perspective from which my intercultural stance might yet be combined with a recognisable professional form of scientific knowledge production?

I had now in my possession these mysterious rough wooden tablets of the sangoma oracle, consecrated in the blood of my sacrificial goats, and periodically revived by the application of fat (from these victims, or bought as packaged neo-traditional medicine) and by immersion in water of a year’s first rain. I could throw these tablets, and interpret the sixteen different combinations they could assume in terms of an elaborate interpretative catalogue that I had gradually learned during my training as a sangoma; the interpretation would yield me knowledge of the ancestors’ wishes, messages and grudges, would reveal a patient’s life history to me, as well as his current illness and venues for cure and redress. The tablets seemed to represent the epitome of strictly local cultural particularism. It was as if they had risen from the village soil of Southern Africa at some indefinite Primordial Age, and the same seemed to apply to the interpretation scheme that names the sixteen specific combinations which may be formed by the tablets when these are ritually cast. The local oracle of four tablets had been described by missionaries as long as four hundred years ago.1 ‘The old woman like a stone’, ‘the old male witch like an axe’, ‘itching pubic hair like a young woman’s’, ‘the uvula like a youthful penis’ – this is how the four tablets are locally circumscribed, and their various combinations have connotations of witchcraft, ancestors, taboos, sacrificial dances, and all varieties of local animal totems. What could be more authentic and more African? Not for nothing had I, at the time, described my initiation (which, after more than twenty years of work as a religious and medical anthropologist, made me an accomplished and recognised specialist in an African divination and therapy system) as ‘the end point of a quest to the heart of Africa’s symbolic culture’.2

---

1 Cf. dos Santos 1901; van Binsbergen 1996b.
2 Van Binsbergen 1991b: 314, = chapter 5; obviously I then used the concept of ‘culture’ in a different sense from my present argument.
However, the illusion of immense local authenticity would soon blow up in my face. Before long I had to admit that this romantic suggestion of extreme locality was mere wishful thinking, under which lurked a reality that had enormous consequences for my theoretical and existential stance as an ethnographer and a world citizen. The interpretational scheme, right up to the nomenclature of the sixteen combinations, turned out to be an adaptation of tenth-century (CE) Arabian magic, with a Chinese iconography (consisting, just as in the *I Ching*, out of configurations of whole and broken lines), and, in addition, astrological implications such as had been elaborated another fifteen or twenty centuries earlier in Babylonia. The local cultural orientation in which the inhabitants of Francistown had entrenched themselves, and from which I initially felt painfully excluded, turned out not to be the incarnation of absolute and unbridgeable otherness at all, but – just like my own cultural orientation as a North Atlantic scholar – a distant offshoot of the civilisations of the Ancient Near East, and like my own branch of science it appeared to have been effectively fertilised by an earlier offshoot from the same stem: the Arabian civilisation. I had struggled with the other, as if it were an unassailable, utterly alien totality; but parts of it turned out, on second thoughts, to be familiar and kindred, and available for appropriation.

Clearly, such a position smacks of the denial of difference in favour of an imposed claim of sameness, and was destined to make me extremely unpopular (as I was to find out bitterly) among the small group of intercultural philosophers, for reasons discussed above (section 15.3.4). But, at the time, anthropologists still constituted my main frame of reference. And among them, the insights derived from my *sangoma* divination study have led to a head-on collision with the central theory of classic cultural anthropology since the 1930s: the historical and cultural specificity of distinct, for instance African, societies, the assumption of their being closed onto themselves and bounded, of their having a unique internal integration and systematics, in general the idea that something like ‘a culture’ exists, and the absence, or irrelevance, of comprehensive, long-range cultural connections in time and space.

This insight was for me the trigger to start a comprehensive research project, which has meanwhile resulted, among other publications, in an edited collection *Black Athena: Ten Years After* (1997; now being reprinted as *Black Athena Alive*), on the work of Martin Bernal; a book manuscript entitled *Global Bee Flight: Sub-Saharan Africa, Ancient Egypt and the World: Beyond the Black Athena Thesis*; one on *Four tablets: A Southern African Divination System Traced in Space and Time*;

---

1 From numerous discussions of this Ancient Chinese divinatory text I mention: Legge 1993; Jung 1974a; Wilhelm 1948.
3 This is no exaggeration, cf. the extensive criticism of this line in my work by Amselle 2001: 53f; Amselle’s disgust is so great that he can only understand my defence of Afrocentricity as an act of sheer opportunism – which I then happen to share, much to my honour and pleasure, with another target of Amselle’s, Cathérine Coquery-Vidrovitch, one of France’s leading African historians (Amselle 2001: 109f and n. 90).
and another one entitled *Cupmarks, Stellar Maps, and Mankala Board Games: An Archaeoastronomical and Africanist Excursion into Palaeolithic World Views*. These books are all in the final stages of preparation for publication and will appear from 2003 onwards. I also embarked on comparative historical studies of animal symbolism, one of which, *The Leopard’s Unchanging Spots*, is a direct by-product of the present book.

*Global Bee Flight* is based on a similar *Through the Looking-Glass* (Lewis Carroll) experience as I had in connection with the Francistown divination system. A few years ago I went through my various articles on western Zambian kingship in order to collect these into a single volume. This was shortly after I had spent a year at the Netherlands Institute for Advanced Study (NIAS) in 1994-95, as the only anthropological member of the Working Group on ‘Magic and religion in the Ancient Near East’. After this extensive exposure my eye was suddenly and unexpectedly caught by the many specific and profound parallels between the ceremonies and mythologies surrounding Nkoya kingship in South Central Africa, and in Ancient Egypt, Mesopotamia, and South Asia. The parallels were so striking, so detailed, that I had to consider seriously the possibility of cultural diffusion, either way or both ways, between these various regions and South Central Africa – once again the suggestion of continuities in space and time across thousands of kilometres and across several millennia.

The Francistown divination system and Nkoya kingship are two concrete examples of the kind of serendipities – totally unexpected finds – of cultural convergence and diffusion across the entire Old World that have occupied a central place in my empirical research since 1990. But there is also a more systematic source of inspiration: the anthropological fieldwork that I have undertaken over the past thirty-odd years in various locations on the African continent. In some of these African settings I have been treated more as a stranger than in others, but I have always felt myself to be on fundamentally familiar grounds in Africa, in human life-worlds I could readily explore, understand (their beautiful languages were surprisingly quickly picked up), love and even anticipate, full of situations that reverberated deep-seated affinities, instead of in alien and exotic abodes of exile that made no sense to me and left me a total stranger. In combination with the scholarly literature, discussions with my colleagues, and with my involvement in the work of my Leiden colleagues and of my research students, these researches have created a context for comparative hypotheses suggesting considerable correspondences between local cultural orientations far beyond the strictly local and presentist horizons of classic ethnography – far beyond ‘cultures’ ...

1 Carroll 1998.

2 The topic of Afro-European or Eur-African cultural and historical continuities is pursued at length in van Binsbergen, forthcoming (a), (e), cf. 1997c.
15.11. Against Eurocentrism

Against this background I immediately recognised a kindred spirit in Martin Bernal, the author of the multi-volume book *Black Athena: The Afroasiatic Roots of Classic Civilization*.1

Bernal intends to expose the Eurocentrism that – as he demonstrates – has been at the roots of the North Atlantic study of Graeco-Roman Antiquity over the past two centuries. In Bernal’s opinion, the widespread idea of being heirs to the genius of Greek civilisation, allegedly without roots in any previous non-European civilisation, has played a major role in the justification of European intercontinental imperialism. His central thesis is that we must recognise the African and Asiatic roots of classical Greek civilisation (especially of its language, philosophy and religion) – and in doing so, we should also recognise the non-European roots of major cultural orientations in today’s North Atlantic civilisation, that is becoming increasingly global anyway. Hence the pragmatic title of Bernal’s magnum opus, *Black Athena*: this title refers to Bernal’s (and Herodotus’s) claim that the goddess Athena, although the central symbol of classical Greek civilisation, had yet an origin outside Europe, in Africa. The question is not without interest for philosophers in that the principal stake in the *Black Athena* debate is the claim concerning the non-European origin of the European philosophical tradition.2

With *Black Athena: Ten Years After* (1997)3 I reopened the debate on Bernal’s work that appeared effectively to be closed after the devastatingly critical *Black Athena Revisited*.4 With the new book, *Global Bee Flight*, I return to Africa in order to investigate the implications of the *Black Athena* thesis for our current research concerning that continent – and the implications of that research for the *Black Athena* thesis. Because Ancient Egypt occupies a key position in the debates on Africa’s cultural historical relation to Europe and to the rest of the world, a large section of *Global bee flight* is occupied by an analysis of the mutual interpenetration of Ancient Egyptian and sub-Sahara-African themes, in the way of concepts and structures of thought, myths, symbolism, the kingship, state formation, and productive practices. One absolutely surprising outcome of the book (when I started out I sincerely thought I could prove the opposite to be true!) is my confirmation, without the slightest reservation, of one of the most ridiculed ideas of early twentieth century anthropological diffusionism: Egyptocentrism as a possible model for African cultural history. By the end of the fourth millennium before the common era, Ancient Egypt owed its emergence as a civilisation (contrary to what Bernal, from a more purist Afrocentrist viewpoint, thinks to be the case) to the interaction between

---

3 Van Binsbergen 1997a.
4 Lefkowitz & MacLean Rogers 1996
Black African and Eastern Mediterranean/West Asian cultural orientations. But, in the next step, my analyses demonstrate that Ancient Egypt, in its turn, did have a decisive fertilising effect not only (as stressed in the Black Athena thesis) on the Eastern Mediterranean basin and hence on Europe, but also, in a most significant feedback process, on Black Africa, right into the nooks and crannies of many aspects of life, including the kingship, law, ritual and mythology. Instead of the patchwork of totally distinct 'cultures', which is the dominant view among both scholars and the modern world at large, what thus emerges is an image of Africa that displays a very remarkable cultural unity. And such unity springs, not from any timeless and somatically based Black mystique of Africanity, but from clearly detectable historical processes:

- having first served as a (not: the) major source, and
- subsequently as a principal recipient of Ancient Egyptian civilisation, meanwhile
- undergoing the unifying force of the rapid expansion of the Niger-Congo linguistic family (including the Bantu sub-family) from an epicentre between Nigeria, Cameroon and Chad as from 3,000 BCE, and finally
- as a recipient of converging Arabian/Islamic influence
- as well as – in the most recent centuries – North Atlantic colonial influences.

The general conclusion of Global Bee Flight is a radical, positive and (coming from what looks like a White establishment scholar) unexpected revision of our conception of the place of Africa in global cultural history. Meanwhile there is little reason why the same model of qualified continuity over large distances in space and time could not also apply to other continents, including Europe, and to the historical connections between various continents.

I have given reasons why (as an apparent reduction of difference to sameness) the argument of the convergence of African cultures (one of the tenets of the recent Afrocentrist movement, and a constant idea in Black consciousness for two centuries) is shunned by post-structuralist intercultural philosophers, but it is strange that this idea of convergence has met with so little acceptance on the part of African philosophers today. Instead they virtually unanimously support the argument of cultural diversity. For instance, with Mudimbe, Appiah shares the position of being a leading philosopher who, while having been born in Africa, has resisted the temptation to identify with the production of a parochial form of African philosophy and instead produces a cosmopolitan, mainstream brand of thought that is eminently acceptable to most North Atlantic academic audiences, not in the least because it shuns all Afrocentrism and in general takes a reserved, deconstructivist attitude towards any African identity discourse. With reference to the work of the Senegalese natural scientist and cultural philosopher Cheikh Anta Diop, more than in respect of

1 Cf. van Binsbergen 2001a.
Bernal’s work (of which incidentally he does not approve any more than he does of Diop’s),\(^1\) Appiah rejects the idea of any cultural continuity permeating the African continent today. For this he adduces not the fruits of any independent historical research of his own, or of others for that matter, but (in the best philosophical tradition of canonical botanising) two self-evidences that are absolutely untenable however in the light of recent historical research: the claim that Ancient Egypt had only a non-specialised, vaguely articulated philosophy which moreover is unrelated, in substance, with current African cultural orientations; and the claim that we cannot expect to find, in Africa, cultural continuities extending over a period of three or more millennia.\(^2\) In Appiah’s words:\(^3\)

‘If we could have traveled through Africa’s many cultures in (...) [pre-colonial times] from the small groups of Bushman hunter-gatherers, with their stone-age materials, to the Hausa kingdoms, rich in worked metal – we should have felt in every place profoundly different impulses, ideas, and forms of life. To speak of an African identity in the nineteenth century – if an identity is a coalescence of mutually responsive (if sometimes conflicting) modes of conduct, habits of thought, and patterns of evaluation; in short, a coherent kind of human social psychology – would have been “to give to aery nothing a local habitation and a name.”’ \(^4\)

*Autos efá!* In line with this stress on pre-colonial fragmentation lies the African philosopher’s Kaphagawâni’s thesis on ‘C\(^4\)’, which is a scientific formula (cf. C\(^{14}\), the carbon isotope so vital to historical dating) meant to express

‘the Contemporary Confluence of Cultures on the Continent of Africa. This is a post-colonial phenomenon where different cultures meet and mingle to form new, hybrid forms’.\(^4\)

In this formulation the emphasis on a plurality of mutually distinct and bounded cultures does give way to a recognition of greater unity, but extreme multiplicity and fragmentation is still held to be the hallmark of the African past, the point of departure. Such unity between African cultures as is being recognised is taken to be the result of the post-colonial phenomenon of globalisation (largely perceived as an extra-African phenomenon), which allows this view to salvage the concept of a pristine distinctness of a great number of pre-colonial cultures in Africa. The entire discussion on Afrocentrism (with its Senegalese precursor Cheikh Anta Diop) appears to be lost on the majority of contemporary African philosophers.\(^5\) Afrocentrists like Molefi Kete Asante\(^6\) are scarcely welcomed or cited in the circles of academic African philosophers.

---

\(^1\) Cf. Appiah 1993.
\(^2\) Appiah 1992:16ff. For a refutation of these two points, see my *Black Athena Alive* (van Binsbergen, in press), especially the contribution by Stricker c.s., in press; and van Binsbergen, forthcoming (a), (e).
\(^5\) However, see: van Binsbergen 1996a, 1997a. For the reception of the *Black Athena* discussion among African and African American intellectuals, including Appiah and Mudimbe, cf. van Binsbergen 1997b; Berlinerblau 1999.

15.12. To intercultural philosophy as a medium

What then could be the contours of an intercultural philosophy that allows itself to be inspired by empirical research, but that essentially renews and transcends such research?

The dialogue is not only one of the oldest philosophical genres, it is also a form of communication that has established itself in the modern, and especially the postmodern, world as the most ideal form: with assumptions of equal contributions from both sides, equal initiative, equal rights, for the participants in the dialogue. One tends to assume that, from a pluralistic perspective, the dialogue offers the best possible conditions for revealing the relevant aspects of a matter, perhaps even revealing truth itself. The word ‘dialogue’ is often mentioned in the same breath as the word ‘intercultural’. In my own work, too, I have repeatedly been occupied with the dialogue as a therapeutic instrument for the illumination of personal and group problems and for the attainment of reconciliation, as a principal African social technology. Whoever seeks dialogue is not satisfied with the mechanical, cold juxtaposition of difference; agreeing to disagree, to differ, is a sign, not of dialogue, but of the incapability of arriving at dialogue. The dynamics of dialogue always consist in making contradictions visible, then exploring the conditions under which these contradictions may be transcended in the direction of a new point of view that was not yet available from the very first but that emerges creatively from the very dialogue itself. The true dialogue is implicitly a form of reconciliation.

The anthropologist Michael Jackson (not to be confused with the once popular singer of that name) is one of the contemporary ethnographers who displays great sensitivity for problems of intercultural philosophy. His inspiration is primarily with Sartre’s existentialist philosophy, and with Merleau-Ponty. With his work Jackson seeks to create a dialogue between people of various cultural orientations:

‘But while my interest lies in the kind of metacultural understanding that Sartre and Merleau-Ponty sought, this should not be construed as a search for the essence of human Being but for ways of opening up dialogue between people from different cultures or traditions, ways of bringing into being modes of understanding that effectively go beyond the intellectual conventions and political ideologies that circumscribe us all’.3

However, Jackson’s ethnographic interlocutors do not speak for themselves. Some-what like a boy who out of boredom (or keenness on certain victory) plays a boardgame against himself on a rainy afternoon, Jackson himself conducts vicariously both sides of the conversation in his book. He does so in a form that is

2 Chapter 11; also van Binsbergen 1994d, 1995a.

3 Jackson 1989: x.
not compellingly imposed either by the people under study, or by Jackson’s professional habitus as an anthropologist within the North Atlantic society.

In which cultural orientation does the ethnographer in fact find herself when she makes pronouncements about the cultural orientation under study: in an African orientation, a North Atlantic one, in both, or in neither? One school of anthropology in which this question has been at the centre of reflection has been the Louvain School, created in the 1980s by René Devisch (one of the people to whom Jackson’s major book *Paths towards a clearing: Radical empiricism and ethnographic enquiry* was dedicated). In the texts produced by the Louvain School, a characteristic figure of style has been the following. The writer leaves unspecified who in fact it is who is speaking: the ethnographer, or a characteristic member of the society she describes. Unmistakably, this practice has been inspired by a justified critique of certain hegemonic and objectifying aspects of the ethnographic relationship. In the Louvain case, moreover, this practice is usually carried out by meticulous hermeneutic ethnographic methods on the basis of a profound language mastery. Yet one cannot fail to observe that it is impossible to solve the hegemonic problematic of ethnography, by dissimulating that problematic (as the Louvain figure of style seems to do).

Therefore, and once again: in which cultural orientation do I find myself when as a *sangoma* in the Netherlands I offer a Southern African therapy system that is far from self-evident to most of my Dutch clients, but whose being offered by me is neither self-evident to most of my Southern African clients even though they clearly have no objection?

Mediating between two cultural orientations means that the mediator provides himself with an interface, a plateau, from which access to both cultural orientations may be gained, but that is yet not to be reduced to either. Intercultural communication is always transgressive, innovative, subject to bricolage. Genuine differences, that are base not on a performative act of will but on the inevitable, inescapable parallel implementation of two opposite and mutually irreducible points of departure, can only be reconciled (in dialogue, love, seduction, trade, diplomacy, therapy, ritual, ethnography, intercultural philosophy) in an innovative way that essentially takes a distance from each of these points of departure and that is not compellingly imposed by either. For this purpose a new frame of reference is conjured up, one that, on the one hand, confirms both positions (they have to be declared valid in order to make the position of the mediator acceptable), but that, on the other hand, transcends them, while making reference to a good which for both parties – but not necessarily in the same way – represents a major value. This is in a nutshell the mechanism I have sketched above (chapter 11) in my analysis of African reconciliation; it appears as if the same mechanism helps to elucidate, and to facilitate, intercultural exchanges including intercultural knowledge production – but at the cost, for a long time already recognised by modern hermeneutics,¹ of

---

producing not a faithful representation of the original, but an innovative novel creation whose resemblance to the original may be remote.\footnote{Cf. chapter 11: my discussion of African reconciliation.} We continue to be haunted by Kant’s epistemology,\footnote{Kant 1983c.} distinguishing the allegedly unknowable original from the known and appropriated, but inevitably distorted, mental image we have formed of the original.

I see my task as an intercultural philosopher primarily as that of a mediator, striving towards an empirically underpinned and practically applicable theory of cultural mediation. On the basis of inspiration from the empirical social sciences and of introspection based on my own extensive intercultural experiences (as documented in Parts II and III), I seek to explode the philosophical self-evidences with regard to ‘culture’, in so far as the latter form the point of departure for all thinking about interculturality. I seek to explode the social scientific self-evidences of theory and method by reference to the much greater accumulated experience of modern philosophers when it comes to the handling of concepts and methods of thought; evidently, for this task I shall need the constant support and criticism from my new philosophical colleagues. Interculturality presupposes a medium that cannot be relegated to any of the cultural orientations which are being mediated within it; this opens up an immense space for thought experiments and imagination. On the other hand, an empirical orientation means that we resign ourselves to impose limitations in this experimental and imaginary space, not only by explicit and intersubjective procedures, but also by a critical awareness of our epistemology, of its globally available alternatives, and of empirical facts as studied by cultural anthropology, history, linguistics etc. The challenges and potentials for intercultural philosophy are boundless, and so is its prophetic responsibility in the contemporary world.

15.13. Cultural diversity and universality
These considerations lead us to what is, next to the question of humanisation from pre-human ancestors, and the possibility of intercultural knowledge and of intercultural ethics, one of the central questions of the philosophy of culture: Why should there be this fragmentation of cultural orientations, this multiplicity of pattern formation? Is it proper to the human condition? To language? To sensory perception? To thought? To the handling of symbols? To a specific historical phase in the human condition, which perhaps we are at the point of leaving behind us? The latter hardly seems likely, for the predictable stopgap of every argument on cultural globalisation so far has been the emphasis on the articulation of an ever greater proliferation of separate identities each marked by token cultural differences.\footnote{Cf. Appadurai 1997; Brightman 1995; Featherstone 1990, 1995; Friedman 1995; Hannerz 1992b; Robertson & Lechner 1985; Robertson 1992; van Binsbergen 1994a, 1997f, 1998a.} There is every indication that the philosophy of interculturality will only come of age when
it has developed a convincing argument explaining the tendency to fragmentation in human collective patterned arrangements.

The Ghanaian philosopher Wiredu posits\(^1\) that ‘cultures’ must necessarily contain a universal component because without this the communication between ‘cultures’ would be impossible, and (according to him) in actuality we see everywhere around us that such communication is a fact.

Exactly the same argument is used by Sogolo against what he considers to be Winch’s extreme relativism.\(^2\) In passing, Sogolo appeals to the principle of charity as formulated by Davidson. Sogolo thus applies this principle (as others tend to do)\(^3\) as the *deus ex machina* of interculturality.\(^4\) In Davidson’s view, consistency is an indication of truth. The principle of charity stipulates that we are prepared to accept as true whatever appears to someone else to be true. But underlying this technical logical usage shimmers, not by accident, the more original meaning of charity as *love for thy neighbour*, the Ancient Greek and early Christian concept of *agape*. The intercultural implications of this view are hardly investigated by Davidson, but they amount to the kind of epistemological relativism that was formally pretended by classic cultural anthropology but that in fact – as I argue elsewhere in this chapter – has never materialised in that discipline. My argument on becoming a *sangoma*, in chapters 5 and 6, makes it clear that it is precisely the principle of charity, in the Davidsonian sense, that almost expelled me from ethnography.

Apparently Wiredu’s intuition brings him close to realising the social implications (i.e. Shen’s dilemma) of the problem that ‘cultures do not exist’ (any more). Yet Wiredu’s allegiance to the established concept of culture prevents him from offering an adequate solution, even, in fact, from formulating the question with sufficient precision. Admittedly, interculturality would be an impossibility in a situation marked by the coexistence of a number of absolutely distinct cultures side by side, each culture allegedly offering to its adherents a total ordering of their life-world. If we find this an undesirable conclusion (and as world citizens at the beginning of the third millennium CE we have no other choice but abhorring such a conclusion) then we have the following ways out:

- either we postulate (with Wiredu) a universal trait in every ‘culture’ (which would enable us to retain the established concept of culture as holistic and bounded)
- or we take a fundamentally relative view of the totality and the boundedness of culture, by postulating that every human situation always involves a variety of cultural orientations, between which there is a constant interplay, both within one

---

\(^2\) Sogolo 1993.

\(^3\) E.g. Procée 1991: 143; Lepore 1993.

person with his many, varied, and other contradictory roles, and between a number of persons in their interaction with each other.

In the first case intercultural communication is the exception, in the second case it is the rule, the normal state of affairs. From my argument it is clear that I prefer the second solution by far.

But let us pause a moment to consider Wiredu’s argument. What is the evidence that ‘cultures’ – or even, that the far less comprehensive cultural orientations that I would put in the place of ‘cultures’ – do in fact communicate with one another? How would they be implemented to do that? How can we even so much as perceive ‘cultures’? A culture is a highly aggregate, abstract construct (a construct both of the participants, and of the ethnographer) that escapes direct observation precisely as far as concerns its proclaimed totality, for such totality is only presumed and is in fact illusory. All that is open to our sensory perception is the concrete behaviour of persons, and the material effects of that behaviour in the form of objects made or transformed by humans. If these humans do not share our cultural orientation to begin with, our fellow humanity enables us – if only after very substantial ethnographic and linguistic investments in terms of participant observation and language acquisition – to understand this behaviour and these objects in terms of the participants’ intentionality and signification; in this way, what we observe becomes more than unpredictable, purely individual, behaviour: we are capable of discerning collective patterns that persist in more or less unaltered form over a certain period of time – the indications of cultural orientations.

Unmistakably, two regimes of pattern formation may influence each other, as anyone can see from the interference patterns that emerge when one casts two stones simultaneously into the water. But this is fusion, not communication; communication presupposes a medium at both sides of which the communicating entities find themselves, in such a way that in communication their being distinct and separate is both confirmed and dissolved at the same time – we might say that they constitute themselves as different precisely in the process of communication, of communicative union, of sameness.

We are used to thinking about ‘culture’ as a context of communication: to the extent to which we share the same cultural orientation, we can communicate with each other. But there is a snake in the grass here: to the extent to which we share the same cultural orientation, there may not even be anything left to communicate; intracultural communication is different from intercultural communication, but it is no less problematic: both forms of communication depart from the premise of a difference that is being reduced by communication.

Regardless of the question of whether ‘cultures’ do or do not communicate with each other, it is an empirical fact that the bearers of explicitly different cultural orientations are capable of establishing at least a measure of communication, how-

---

ever defective, between their respective cultural orientations, and these bearers produce their identities and their cultural orientations precisely in the context of that communication. Are we then allowed to reverse the argument and to claim that it is not so much the difference between distinct cultural orientation which makes intercultural communication possible, but that it is the communication itself (the intercultural communication, formally, but now we no longer know what meaning to attribute to ‘intercultural’) which engenders the positions of cultural difference in the first place? Such a view is perfectly in line with the performative and strategic use of claimed cultural difference in the context of the multicultural society. At the experiential level, it is confirmed by the professional experience of the ethnographer outside the North Atlantic multicultural society. For her professional role forces the ethnographer to a communication in the context of which, initially, she painfully experiences, and tends to reify, cultural differences vis-à-vis the local others; but gradually, as she learns and internalises the hosts’ cultural orientation, it loses all exotism for her, as a result of which the initial cultural difference appears as a temporary artefact of the initial communication situation. Frederick Barth’s ground-breaking work on ethnicity could be very well summarised in terms of the idea that communication (and in fact all human interaction is communicative) produces cultural difference instead of a pre-existing cultural difference engendering, secondarily, specific forms of intercultural communication.1

Recent research has found ample evidence for the thesis that genetic and linguistic boundaries to coincide; the effect of language, and by implication of all cultural difference, is to create and sustain a specific local gene pool.2 Why it is so important for human groups to have a specifically local gene pool may be explained by Hamilton’s theory of inclusive fitness: altruism has survival value only within a relatively small group, and linguistic and cultural differentiation helps to keep that group small.3 And in the end it dawns upon us that these ideas refer back to what is in fact the oldest recorded theory of ‘culture’: it is the myth that sees in the construction of the tower of Babel (by far the greatest communicative and collective effort of humankind at that time, regardless of whether it was real or only mythical) the origin of all cultural and linguistic diversity.4 It is remarkable that this myth can be found all over Africa under conditions impossible to explain away by reference to the influence of the two world religions Islam and Christianity.5

1 Barth 1969; Govers & Vermeulen 1997.
4 In recent decades, the Tower of Babel has acquired a new connotation since this image was chosen as the emblem of a large international project, initiated at the Jewish University in Moscow and comprising, among others, Leiden University, to compile widely accessible and reliable etymological databases of as a stepping stone towards the reconstruction of mankind’s first language.
5 Cf. Sasson 1980; Frobenius 1931: 169; Roberts 1973: 30f, 147f; van Binsbergen 1981a: 335; van Binsbergen 1992a: 149f, 235. Babel is mentioned once in the Qur’an (2: 96), but as a centre of magic, not of architecture or of ethnic or linguistic diversity.
A similar argument as that of ‘cultures do not exist’ may recently also be heard with regard to language. Language as a distinct, integrated, bounded system would then be a mere construct (created by, for instance, lexicography, language teaching, language politics). Any idea that there would be a distinct language such as Dutch, Yoruba, Navaho or English, would then be exposed to be a regrettable, essentialistic misunderstanding. The idea is attractive in our present day and age of globalisation and the multicultural society. However, the tens of thousands of professional linguists who have spent their lives mapping out the differences and internal systematics of what they have considered to be the world’s thousands of languages, have left us with an enormous body of evidence precisely in favour of separate languages as distinct, integrated, systems – perhaps not so strictly bounded at their fringes, but very clearly distinct and identifiable at their core. This evidence cannot be explained away simply with a constructivist argument to the effect that the idea of such bounded multiplicity has merely served the professional interests of linguists. Current work on linguistic macrofamilies shows, just like current work on cultural and ethnic dynamics, considerable continuities between language families i.e. within macrofamilies, and even some continuity between macrofamilies. Yet we have ample reason to assume that such distinctiveness as cultures also take on, are indissolubly tied to languages and their individual specificities. Probably the one Mother Tongue of mankind, allegedly spoken some 200,000 years ago, is not a mere illusion and some of its features (e.g. primordial words for ‘bottom/ground-dweller/human being’, ‘water’, ‘rain’, ‘speckledness/leopard’, ‘butterfly’) are now beginning to be reconstructed with some limited degree of plausibility. Yet as soon as language comes over the horizon of such uncertain speculation and begins to be reconstructable in some detail (by the Upper Palaeolithic, no more than 30,000 years ago), what we discern is no longer primordial unity, but a linguistic diversity and fragmentation probably greater than ever afterwards in the history of mankind.

All this serves as a reminder that, although ‘cultures do not exist’ any more in our time characterised by globalisation and the multicultural society, this may largely be a recent phenomenon, whereas by far the longest period in the history of mankind has been characterised by a situation where the interplay between the boundedness of cultures and languages, on the one hand, and, on the other hand, the dissolution or transcendence of these boundaries in human interaction and understanding, created the dynamics for social life, identity, and change.

But whatever the justification, à la Hamilton, of parochialism in the earlier history of mankind, the advent of nuclear weapons, and in their wake globalisation and the multicultural society in the course of the twentieth century CE, have now dramatically enlarged the scope within which altruism has a survival value. These developments have also dramatically enlarged the scope within which the opposite of altruism (entrenched xenophobia, narrowly restricting the scope of humanity with

---

1 Cf. Davidson 1986.
which one wishes to identify, and desiring to reduce the rest to sameness after one’s own image) effectively threatens the future of the whole of mankind. In is it this context that the project of intercultural philosophy situates itself, not as a learned pastime, but as one of mankind’s few remaining survival strategies.
